GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00
GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $225.00 all 3 radios.

GE Mobiles

GE Phoenix SX VHF 16 channel with dual priority scan. Grey case with mic, speaker, and power cord. Tested working. $75.00 each. I have 2 complete.
GE Phoenix SX VHF 128 channel scan. No accessories. Has all 8 proms. $100.00
GE MVS UHF 16 channel scan. With Mic, Bracket, and power cord. $125.00

GE Mastr exec II VHF 75 watt mobile complete with accessories. $60.00 each
GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each
GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00
.GE Ranger VHF 150.-162 100 watt mobile. Complete with cable, Mic, speaker, and S550 control head. This is a great public safety mobile or can be tuned to
the 2 meter ham band. $175.00
GE S990 head. Looks new but I have not had time to test this yet. $75.00
GE S550 head 16 channel looks good but not tested. $35.00
GE Mobile Vehicle Adapter For MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com) With mic, speaker,
and power cable. $100.00

GE Accessories

Mastr II control cable. $8.00 each
Mastr II head for mobile repeater operation. $5.00
Mastr II Mic. $5.00
Mastr II 8 channel tone boards. $5.00
Mobile Repeater cable for Mastr II. $10.00
Mobile Repeater cable for Delta or Ranger. $30.00. I have seen programming cables made from these.
GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2. If you buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.
GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each. I have 2 sets of EC/5C UHF icoms left and I bought 7 sets of 2C UHF Icoms = $30.00 per set. I have 5 sets of these left now.
GE Delta cables. These are the downloading type used with the S820 heads. $40.00 each
Delta mounting plates. $10.00 each
Ranger mounting plate. $15.00
GE S-550 / 500 and others mounting brackets. $5.00 each
GE MPA, MPD, MTL public safety mic. $35.00 each
GE MPA, MPD, MTL standard Speaker mic. $25.00
GE PCS Universal Rapid charger. $35.00 each
GE MPA standard chargers. $20.00 each
GE MPA Rapid chargers. $30.00 each
GE MPI desk charger with wall transformer. $10.00
GE MPI Rack charger, 8 position. 25.00
GE MPI Mobile battery charger, Rare. $20.00
GE Battery discharger analyzer. For MPA, MPD batteries. Attaches to a rapid rack charger with a DB 15 cable and uses a MPD body to attach a battery to. Has LED readout in display area of MPD body to tell discharge rate. Another rare GE goodie. $45.00
GE shoulder strap like new, attaches where belt clip is. $15.00
GE Belt clips. $10.00 each
GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card and

power supply / speaker. $300.00
GE Duplexer part number 19C-307166-P1. Model DB-4075. This is the standard MastrII
Duplexer found in the MastrII cabinets. With the harness. $125.00

Other Radios and Accessories

Icom 3200 a Dual band ham radio. Has box and manual but no mounting bracket. Has tone squelch board installed. $225.00
Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland. $75.00
Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00
Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00
Motorola P200 VHF 136. - 150.8 high power. New battery and charger. 2 channel but can be made into a 6 channel easily. This would be a great ham radio. $115.00
Motorola Saber 1E UHF 440-470 high power. Nice radio 24 channel. Has pocket charger. $185.00
Motorola Mitrek VHF high 110 watt drawer only. $50.00
Motorola Adapter for MX radios for the 1801 suitcase programmer. A and B prom. $175.00
Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all
Motorola UHF Convert-a-com Amp. 5 in 40 watts out. $45.00
EF Johnson 242-8600, 800 MHz LTR I have 4 of these. $25.00 each
EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00
Kenwood TK 940, 800 MHz dash mount radio. $100.00
Uniden SMS 825 ts, 800 MHz Dash mount radio. $75.00
MRC 100 Repeater controller in rack mount. $100.00
Voter from IMTS phone system. 2 rec and 2 tx cards. $40.00
Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00
Antenna Specialists on glass 440 antenna. New old stock. $22.00
Antenna Specialists on glass 220 antenna. New old stock. $22.00

Consignment section

This area is for a few friends who like those other radios you know "Motorola" They are good people and I will pass along any trades you may wish to make.
Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete. $425.00
Motorola Maratrac VHF 100 watt 16 channel head, Never mounted in a vehicle.$375.00
Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each
Motorola HT1000 Intrinsically safe, Re-cased looks new. 16 channel scan with charger. $425.00
Motorola P200 UHF high power. 6 channel. $150.00
Motorola MT1000 UHF 16 channel scan. $250.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, anything you have extra. MPA or MPD portables what do you have and what do you want for them?
Johnson scorpion program cable. PSX200 UHF mobiles.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. If I think it may be bad I will not list it. I take cash, Postal Money Orders, Paypal, and checks but I hold them for up to two weeks to clear before I ship. If you have a question E-mail me.

The 7.2 v NiCad is more appropriate for high transmit duty cycles
while the NiMH seems to last longer on stby and Receive. I have
1400 MAh WWAssociates NiCad AND a standard pack I repacked
with 5 ea. 1100 MAh tab AA cells, which is more compact and less
prone to self-discharge. But, NiMH don't last as long at 1 hr
charge/discharge rates.

If you can bust open your old pack (lots of monkey snot glue)
You can repack your own very reasonably. I got mine from
http://www.allelectronics.com for under $2 ea and have been
doing well for the last 3 years.

Another tip: With the 7.2v pack, set power to L3 or less.
At this voltage, HI draws more current but doesn't make
any more power (more heat).

I have mine in mint condx. I loved it while it worked. One day while transmitting it went dead. No indication power is on, nothing. Would like to know if anyone else has had this happen. Fuses inline are good. For a radio advertised to be Mil-spec it leaves a lot to be desired. I'd hate to be in the military using this thing. What gives in service cost for a radio that only costs $140 +/-?

Hehe, I was gonna suggest that too but I figured it was a 'bad' answer
and I'd get flamed. Refurbing an old set can provide many more 'hobby
hours' as opposed to simply opening the can and serving the dish.

: >
: > This radio has ... a frequency counter ...
:
: Interesting idea. I wonder if this will be useful for identifying
: the frequency of an unknown transmitter so one can monitor it.

It is also submersible!! I wonder if the radio has
military applications? The Taliban were using Icom
IC-706 and Yaesu FT-100 radios.

Here is a piece from Strong Signals (http://www.strongsignals.net)
New Yaesu VX-7R!
Posted on 03/19/2002 07:03 EST

Our thanks go to Kaehu Shapiro, WH6WW, for sending word of the
recently FCC certified Yaesu VX-7R! A kissing cousin to the well
received VX-5R, the 7R looks to be basically the same size but
includes a number of new features. The receive range has also been
widened to include the missing VHF chunk that bothered me on the 5R.
And like the recently released VR-120, the 7R has a limited range
frequency counter.

It looks built to be capable of being run over over by a tank or taken
along by a SEAL team on underwater demolition ops

Looking over the docs on the FCC web site I was able to put together
the following Radio Reference page on this new, quad-band HT.
http://www.strongsignals.net/access/content/rr_vx-7r.html

The Elecraft K2 in base configuration is a QRP rig. Well, close to it. Mine
puts out almost 15W on some bands, although I never use it over 10W. It
can be built to 'fine tune' it to closer to 5W max if you're really serious about
QRP. If you build it that way, it's slightly more frugal with the battery than
it is if you 'turn it down' to 5W.

But if you're not into QRP, there is an optional kit to make it a QRO rig.
At one time they were talking about a 50W or a 100W option.

I know they've tested it, but I don't recall if it's offered for sale yet.
Obviously not a battery power rig anymore. In fact, you have to give up
the 'top panel' options for it. That means no internal battery and no ATU.
But the ATU is for 20W max anyway.

Now, who knows if the optional QRO will ever finally make it out, but
the rig is a nice piece of work even as is. And if you want to build QRO,
build an amp for it. There's already kits (or at least, parts list as 'pseudo-
kits' what with the FCC rules to prevent abuse on 11M) for amps on the
market for the K2 and 817 that are attuned to the fact it's a QRP rig.

I thought about an outboard amp at home for mine, but it just seems I'm
not having too much trouble with just 10W.

Mike

Most likely, but at what distance? Do I have to get within inches of the
transmitter or could I be, say, 10 feet away?

OK, the K2 I believe is now available with the 100W option.

As far as I can tell, none of the kits have all the features of the rice boxes, depending on what features you care about. The K2 trades off some of the frills of the mid range commercial rigs to get top of the line receiver performance. There are a number of K2 features not found in the commercial rigs, but they tend to be features of interest to QRPers. A fully decked-out K2 is comparable in price to a mid-range commercial rig. The receiver specs are more comparable to a Japanese rig three times the price.

(oh yeah, the obvious URL http://www.elecraft.com, also see the reviews at the Adventure Radio Society site and QST. ARS has some nice comparative data).

I happen to have a K1, which is a much more limited rig than the K2 (and a much more limited price!) What struck me is the ergonomics. The rig is much better laid out than my Icom. In spite of being a low-end rig, the thing is a joy to use.

It's a little hard to get objective feedback on the K2. People who have them are absolutely rabid about the things. I would suggest finding someone who has one and playing with it a bit. In my opinion, it's a nice rig, and I have played with a couple. But you're not going to learn anything from talking to someone who has one ... they are all blinded by the Elecraft mojo.

..

Well, I take that back. People on the Elecraft reflector are talking like they have the 100W option, but I see no trace of it on the web site. (Since I'm not a QROer, I have to admit blowing by all those notes about the amp anyway).

k5oor's first build of his HF Packer amp is closed, next build likely not until the end of the year (http://www.hfprojects.com)

Also, I would suggest downloading the construction manual. Heathkit never made a manual as good as Elecraft's.

With the cig lighter plug, yes. That was designed for that function. The charger that comes with it is NOT made to power it while transmiting. It is only for charging. It is in the manual. Unfortunately, my manual is out in my car and not readily accessible, so I can't point out the page number, but it's in there.

I'm going to get rid of my Kenwood 261A radios and would like to find a Yeasu 2600, the one with the serial port on the back.

I have two of the 261A radios, nothing wrong with them and they work perfectly. I have the boxes, mics, cords, manuals, etc.

Make an offer to buy or trade for cash and a 2600.

I didn't mean charger. I meant the adapter with pigtailed leads on it. No filtering, no connecter except for the barrel plug that connects to the radio. Just a connector and a piece of wire hooked up to a 5 amp power supply.

True, but the dollar devaluation has probably met the collectors'
cupidity half way. (;-)

This came off of the FCC web site. The FCC
certified for sale in the US on March 7th.

And it appears to have 777 channels.

> As far as I can tell, none of the kits have all the features of the rice
> boxes, depending on what features you care about.

I'm personally just interested in a nice stable multimode rig (except maybe CW which I think is obsolete anyway and should no longer be required for licensing) with a digital readout and perhaps a spectrum display, that will cover all bands. SWL bands would be nice too, and if I could afford one, it would also have complete receiver coverage from 100Hz to maybe 1 or 2 GHz. I may need a rice box for all that, I don't know. But if I start wishing and fantasizing, there it goes, from an SB102 to all that. :)

The timer button is a common operating error with the TS940SAT. (A friend of mine missed an
entire contest weekend because of it once).
As for the lack of receive sensitivity, here are a few things to try:
1) Check the ATT is set to 0
2) Check the RF is completely CCW.
3) Check the SSB Slop TUNE is : outer knob CCW, inner knob CW.
4) Check that the NAR button is deselected. (CW filter may have been removed)
5) (rear of radio) Check the RX ANT SWITCH (I can't remember which way it goes, just switch it and see)
good luck

you can also use the '756 as a bandscope for the 850 or any radio with an IF OUT with a freq. below 60mhz

pipe the if signal into the rcv ant jack of the 756 and tune it to the IF of the other rig.....

>I didn't mean charger. I meant the adapter with pigtailed leads on it. No
>filtering, no connecter except for the barrel plug that connects to the
>radio. Just a connector and a piece of wire hooked up to a 5 amp power
>supply.

I believe the original post addressed the issue as to why the VX-5R would not
TX when the included charger was pluged into it.

3935. Help with Power supply

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-23 04:38:04 UTC
From: JEEPMON <JEEPMON@HOTMAIL.COM>
Message-ID: <METm8.91792$Yv2.30617@rwcrnsc54>
Source record: 45738

Alright this may sound stupid but what is the difference between a
'switching' power supply and a power supply???

3936. Re: Help with Power supply

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-23 05:44:22 UTC
From: Mark Little <mark@brigadoon.apana.org.au>
Message-ID: <uo4h7a.jh5.ln@chuckie.apana.org.au>
Source record: 45739

Power supplies come in two basic flavours. The "linear" power supply and the
"switching power supply.

In the linear supply, the control element is like a variable resistor. The
resistance is changed to ensure that the output voltage across teh load
remains constant. It has the advantage of being simple, relatively noise
free and cheap. Its disadvantage is that it wastes a lot of power in the
control element.

In the switching power supply, the control element is like a switch. The
switch is turned off and on rapidly so that the average voltage at the
output varies. For example, it the switch is always off, the output voltage
is zero and if it is always on, the output voltage is the maximum possible.
By having a good filter at the output, the switching waveform is removed and
only the average voltage is seen. The advantages of the switching power
supply is that because the switch is either off or on, the amount of wasted
power is low. The disadvantages include problems with noise caused by the
switching and a more complex design.

Hope this helps,
Mark.

3937. [QST] FT225RD or orther ....

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-23 08:48:20 UTC
From: JMC <jm.caillon@wanadoo.fr>
Message-ID: <a7hffi$2mm$1@wanadoo.fr>
Source record: 45740

Hi !

I am looking for a good ring for VHF (FM&BLU). After reading many opinions on existing equipments, it seems that there is no "very good" one for basic operations ....I mean just Receiving and Transmitting ..... without gadgets ... !!! :-)))

FT225RD seems fine ..... but old and heavy ..... but it looks like my old FT902DM . What do you think about FT225RD ? Have you ever use it ? Where can I buy one ?

Thanks for your comments

Regards

Jean-Marc

I belive you can order a couple of samples free from their website
once you've registered your details.
You could also use the pin-compatible MAX202.
You can certainly order up to 2 free of the Analog Devices equivalent
from their website (www.analog.com) , ADM232A or better ADM202.
Again you have to "register" the first time you use the free sample
service - not needed for subsequent requests for other parts.
Finally, best part to use would be ADM202E as you would get a more
robust part (E= better ESD protection & better EMC characteristics).
The 202 (Maxim or Analog) can use 0.1 uF charge pump capacitors
which should be smaller as well as non-polarised - meaning you can't
insert them the wrong way round :-)

FOR SALE:

Hallicrafters SX-25 Defiant Receiver
Get that awesome push-pull 6V6es sound with this vintage beauty!
General Coverage Communications Receiver Made 1940-1946
Voltages: 100-125 VAC 50-60 Hz
Coverage: 540 - 42000 kHz
Modes: AM/CW Selectivity: 6 positions
Single Conversion Superheterodyne. 12 Tubes.
Size: 19.5x9.5x11.125" = 495x241x283mm
46 lbs. = 21 kg.
Tubes: 6SK7 1st RF Amp, 6SK7 2nd RF Amp, 6K8 1st Detector-Mixer,
6SK7 1st IF ANL, 6SK7 2nd IF Amp, 6SQ7 2nd Detector/AVC/1st Audio
Amp, 6SQ7 Phase Inverter, (2) 6F6 or 6V6 Audio Amp, 6H6 ANL, 6J5GT
BFO and 80 Rectifier.
Features: ï¿½" Headphone Jack S-Meter Tone (2 Pos.) Bandspread, RF
Gain, Mute Line, Standby, ANL, AVC, Dial Lamp, Hinged Top Cover,
BFO, Flywheel Tuning etc. Picture available on request.
Will sell for $140.00 plus shipping

Realistic DX-160 Receiver with Realistic speaker
Excellent condition general coverage shortwave receiver set. Excellent
working condition with repro manual. Picture available on request.
Will sell for $79.00 plus shipping.

National NC-190 Receiver
This is a nifty-looking old receiver with that classic space age blue
finish.
Front panel looks very nice, but some of the knobs look crusty and
need
cleaning. Appears to be all original with no modifications.
Receiver is non working but it is all there, and will clean up nicely.
Picture available on request.
Will sell for $125.00 plus shipping

Knight TR-106 6 meter AM transceiver with V-17 VFO
Excellent looking Allied-Knight 6m AM rig with the matching VFO.
Comes with the microphone and has built-in speaker. Hook up 120V AC
and an antenna and you are on the air. Needs one cable. Otherwise
complete and has very nice appearance. Picture available on request.
Will sell for $125.00 plus shipping

Hammarlund Speaker. I believe this one matches the HQ-110 and other
similar radios. Extra nice condition. Picture available on request.
Will sell for $50.00

Atlas 210 HF transceiver. Includes DC power cable. Needs work.
Cosmetically very good. A couple of extra side holes where a genius
mobile-mounted it. Picture available on request.
Will sell for $115.00 plus shipping

R-268/ARN-5B Command series rare VHF Receiver - Black case, similar
to BC- 733F, but marked for 24V DC and no dynamotor. It's all there
including the shock mounts and special bayonet connectors. Looks to be
in very good condition. Unmodified. Picture available on request.
Will sell for $30.00

Command Set transmitters:

BC-459A complete - have two available. One is black crinkle paint
finish. The other is the silver case. Both are made by Western
Electric and are complete, unmodified, missing one very small cover on
top. Will sell for $40.00 each plus shipping

Boonton Crystal Calibrator Model 111
Excellent condition
Will sell for $25.00

Boonton Crystal Calibrator Model 111-B
Excellent condition
Will sell for $25.00

Shipping is additional on all items.

Shouldn't be too much for a matched pair. A new set will run $75. Might find a used set on Ebay for $40 or less. Also might as well replace the 12BY7A. That's a cheap tube.

I had a Yaesu 101B about 10 years ago. Fine little radio, quality built, and very forgiving. Output on mine was around 125 watts SSB and 90 watts AM. They were very popular radios and parts should be available for them for some time.

After you get a get a good set of tubes make sure you have a good antenna match with very low SWR. That's how you get them to last.

Does anyone know of people who can refinish the cabinet of my Alpha 78 amplifier ??? I've had the amp for about 15 years, and haven't used it for about 12 of those years. It has been under a Covercraft plastic cover for as long as I've owned it. I took the cover off of it the other day, turned it on to blow out the cobwebs, and noticed that the sides, top, and the face are all sticky. My house is strictly a non-smoking environment. Any ideas ???

3960. Monoband HF radio recommendation?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-24 01:47:11 UTC
From: vhfradiobuff@aol.com
Message-ID: <5e5fccab.0203231747.6affca3c@posting.google.com>
Source record: 45663

I am currently learning the code so I can pass the 5 wpm test. I was wondering if anyone could recommend a good monoband HF radio for me to start with. What is a good band for DXing, particularly early in the day, before 1pm EST? From what I understand either 20 or 40 is a good choice. I plan on only working voice, no CW.

Thanks ahead of time.

3961. Icom 821H,SM-8, SP-21

3965. Kenwood TH-G71A Volume Control Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-24 02:53:02 UTC
From: "J. Richard Hanna" <wa8npr@sssnet.com>
Message-ID: <u9qfrnshu1qff2@corp.supernews.com>
Source record: 45670

My Kenwood TH-G71A Handheld over the past several months has developed a problem with it's volume control operation, while the volume level is set fairly low, all of a sudden the volume from the speaker will increase to a much higher level without touching the control. At this point as you turn the volume control down further has no effect on the volume level setting, but as you move the volume knob past it's 12 o'clock position the speaker volume actually increases.

This problem would come and go and sometimes turning the radio off and removing the battery pack and then reinstalling it and turning the radio back on resolved the issue for days. I have most recently tried reseting the radio on power up and it had no effect.

The radios operation seems fine except for it "possessed" volume control operation.

Has anyone else observed this phenomena on their TH-G71A, and if so what corrected it?

Thanks, Rich WA8NPR

You have the "velvetized" paint that was used for awhile.The founder of ETO
told me not to use any cleaners that are rubbed on to remove the
stickiness. He said take off front panel(easy) and soak overnight in water
with liquid detergent in it. Mine is tack free for several years. To
refinish cabinet if scrapes or mars, spray paint over the original paint
with a similar color that is part of a camoflage two part paint using only
the lighter color. you now have a harder non-tacky cabinet. "Ron

Fine folks,

I am looking for a mod for a Kenwood TS-440...
xmit audio monitor... not cw sidetone, already have
that built into the rig. This is for SSB work. I saw
a mod on the net being advertised by someone not
too long ago and now I am interested in getting it.

It would really help when working with headphones
or to monitor my own xmit audio quality to be sure
I am not overdriving or that audio level is good, etc...

Does anyone know where to find this kit or a mod
for sale as a kit or otherwise?

Thanks in advance for your help

I have forsale a Ten Tec argonaut model 505. this radio is from an estate and is being sold AS IS. this radio transmits cw/ssb at 3w's.receives 80-10m but the receiver has no audio output. the vfo will need a pto rebuild, it is stuck and will not tune.the radio has been modified by taking the mic gain and drive control from the rear panel and moving to the front with concentric knobs which are not original. also the bandswitch knob is not original either. this radio is in fair to good condition and with some TLC should make someone a fine ssb/cw qrp radio which is considered a classic. I also have the original manual and schematics for the argonaut. I am asking $165 shipped in u.s. by u.ps. John W3AYT@arrl.net

Patcomm makes a little dual-bander with your choice of any two hf bands. Also, the Ten Tec Scout is available with plug-in modules for each hf band, altho' that radio has been discontinued, and you'd have to look for it used. Still, a used 706 or ft-100 would hardly cost much more, and would give you a full 100 watts out.

First of all, excuse this post if I've chosen the wrong category. I'm not an amateur radio operator, but I have a question about single sideband suppressed carrier transmission that's been bugging me for years. If someone can help me here, or point me to a place where I might find the answer, I would appreciate it.

I understand how AM works and what the sidebands are. But for the life of me I cannot imagine how a single sideband could be transmitted, especially with a suppressed carrier! In order to transmit the modulation, that modulation has to be "carried" on something. If the carrier is suppressed, what is the modulation carried on? And how does the receiver pick up the signal and regenerate the carrier?

If, for example, you have your receiver set for, say, 100 KHz, then it will pick up RF frequencies that resonate at that frequency. But without a carrier, how does it pick up the audio modulation that was placed on that carrier after the carrier has been stripped?

Also, this notion of SINGLE sideband has me puzzled. To me, it's like imagining a length of string that has only one end. If you hold a rope in your hand that is attached to a door knob, you can cause it to vibrate. But the rope always has crests and troughs. How can you have a wave with ONLY crests or ONLY troughs?

In my visualization, a SSB-SC transmission would be like having a string with one end, and then not even having the string! Can someone help me with my perception problem? Thanks.

Source record: 45694

I believe it's not a matter of control, although using control (regulation) is taken for granted in switching supplies.

A typical linear supply (as used by Hams) converts 120 VAC to some other AC voltage using a transformer. It then coverts that AC to DC using diodes. After that, the power is usually filtered using capacitors and sometimes inductors.

That's a basic linear supply. Various improvements can be tacked on, like voltage regulation, overvoltage protection, and current limiting, but they're optional.

A basic switching supply does without the transformer, which can be heavy and expensive, especially, if you want a high-current supply. Simple switching supplies take the 120 VAC and convert it to DC immediately. Then they use switches (i.e., switching transistors) to pulse the DC on and off at a much higher frequency than the 60 Hz 120 VAC it started with (around 20 kHz is common). At this higher frequency, they can convert the power to a different voltage with a much smaller transformer (often a toroid), so the supply is more compact and lighter than the linear supply. And the supply designer can select the output voltage using not only the right transformer but by varying the width of the pulses. Switching supplies end up being more efficient, if designed properly.

One trade-off is that this basic switching supply is much noisier than the linear supply, so you have to pay more attention to filtering.

That's daft it's been FCC type approved

Under US freedom of information act, new radios submitted for type approval
are public information on the FCC website / database
That's how to keep abreast of new radios,
watch the FCC type approval site

Although of course that doesn't mean Yaesu will put into production
Just they now can, for use in the US

With the Kenwood TH-F6/7 selling like hotcakes,
Yaesu will have to bring out something new to replace the VX5

waters and standon are now selling the TH-F7 for 249quid

Hi TS-140 Users,
We have just come up with a TS-140 serial interface kit. The kit includes a newly manufactured IF-10C board that has a built in RS-232 level converter so you won't need an external box. The cables are included also. If you are interested, have a look at:

http://www.piexx.com (Then click on the PIEXX logo followed by the TS-140 link)

Thanks,
-Chris

3994. Re: Kenwood TH-G71A Volume Control Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-24 20:09:28 UTC
From: "Bob M." <xxxxx@yyyy.zzz>
Message-ID: <Ynqn8.69492$Gf.6169444@bin2.nnrp.aus1.giganews.com>
Source record: 45600

No experience, however from the symptom and the fact that the first half of the volume control has no effect, I'd suggest either a bad volume control (inside) or a bad connection on the CCW (low volume) end of the control to ground. Often the radio will have a small value fixed resistor at this end going to ground, so when the pot is set to its minimum level, you will still get some audio. This resistor, or the connections to it, could be intermittent. Once the low end of the pot no longer goes to ground, it just acts like a variable resistor in series with the high impedance audio, and you get no control of it.

Most likely the resistor will be a surface mount component and very difficult to find without a proper service manual and a magnifying lens.

If, unfortunately, the volume control operates some other electronic attenuator, rather than just simply controlling the audio level itself, then the attenuating component(s) could be at fault. This would most likely be the case if the radio is so heavily microcontrolled that some sort of remote volume control (i.e. without turning the knob) is possible.

Hope this helps.

I bought a weather radio from Radio Shack back in January. Its one of the types with the SAME technology. Anyways, I noticed that it stated saying C-OP on its display. After looking up what it meant, it said that the FIPS code must not be correct. I checked the code, and it is indeed correct for my area. If anyone know what else could be causing this, I would appreciate any help. Thanks!

Understanding how AM works can be tricky, and I've seen conflicting
explanations over the years. SSB is usually described in reference to
AM, and that may be a faulty path.

Think of SSB (or DSB without carrier for that matter) as audio translated
to radio frequencies.

So you have a 10MHz carrier, and a 1KHz tone. You mix them together
in a double balanced mixer, which only lets the sum and difference of
the two inputs to pass to the output. For this purpose, the double
balanced mixer is commonly called a "balanced modulator".

The output of this balanced modulator will have the sum and difference of
those two frequencies, 9.999MHz and 10.001KHz. That's double-sideband,
suppressed carrier. It's the same as an AM signal, except no carrier

is transmitted.

I'm sure you can find plenty of descriptions of this sort of mixing. The superheterodyne receiver counts on this, and the principle is the same, no matter if one of the signals is audio or RF. (And most SSB transmitters will include such heterodyne mixers, because this "balanced modulator" rarely operates on the signal frequency.)

You have your two sidebands, each an image of the other. It is redundant information. So for SSB, you eliminate one of the sidebands. Often, this is done by passing the output of that balanced modulator through a filter narrow enough to pass only one of the sidebands, ie 3KHz or less in bandwidth. And there you have your single-sideband signal with no carrier.

(Because of that filter, you usually do another conversion to the signal frequency; it's operation is the same as that balanced modulator. It will take the output of the filter, and a local oscillator of some sort, and mix it to the desired signal frequency. So you have a 10.001MHz signal, nominally an upper sideband signal. Mix it with 5Mhz, for example, and out of the mixer you will get 5.001MHz (the difference) and 15.001MHz (the sum). Each is a mirror image of the other, and of course you only want one. So you'll again have to filter out the unwanted output, sometimes known as the unwanted sideband even in this instant. But unlike the output of the balanced modulator, where the two sidebands were only audio frequencies apart, you have 10MHz between the two images, and they are relatively simple to filter out.)

I've put that aside in, though I also might have started with it. Because the only difference between that conversion and the one in the double-balanced modulator is the frequencies involved.

So your transmitted SSBsc signal doesn't need a carrier, because you do have an actual signal in the RF spectrum out of that balanced modulator. WIth the example above, with only a 1KHz tone going into the balanced modulator, you cannot distinguish this signal from the "carrier" of a CW (continuous wave) transmitter, ie the sort of transmitter used to send morse code. You've just used a roundabout way to generate this signal.

It becomes worthwhile when you are actually using a voice signal, because those audio frequencies will be translated to radio frequencies.

At the receiving end, you use a reverse process. Put the incoming signal into a double-balanced mixer, and put a signal of the same frequency into the other. So you have your 15.001MHz signal from the above transmitter. Put it into a mixer at the receiver, and feed the mixer's other input with a 15Mhz signal, locally generated. The output will be 1KHz (the difference) and 30.001MHz (the sum). The audio circuitry that follows, and your ears, will not pass

the latter frequency, so you now have the 1Khz signal you started with. The receiver translates the incoming signal back to audio.

Now, if I've done this properly, it makes sense. Since AM (two sidebands with carrier) came along first, most descriptions of SSB are extensions of that. But if you start with an understanding of SSBsc or even DSBsc, you may now see that you don't need a carrier. In an AM transmitter, you get the same sort of mixing. But since it's not a balanced modulator, the carrier passes through, along with the sidebands.

You do in fact need the "misnamed" carrier, at some point along the line, to make that translation back to audio. In an AM transmitter, it's an incidental product of the modulator, and doesn't do anything until the signal gets to the receiver. There, it beats in the AM detector to get an audio signal.

It can be inefficient sending this useless carrier along with the signal, though it can also make for a simple receiver. But there is no absolute reason that it has to be sent from the transmitter, because a locally generated "carrier" can give the same effect at the receiving end.

And since the two sidebands of an AM signal are mirror images, again in effect byproducts of a simple transmitter, there is no absolute need to send both of them either.

I have no idea where you are going with the string analogy. I'm not quite sure you do understand sidebands. The analogy doesn't make sense to me, leading me to believe, that you are starting from a false point, and that's getting in the way of your understanding of SSB.

Michael VE2BVW

4009. Re: SSB-SC

Newsgroup: rec.radio.amateur.equipment

Source record: 45614

Thank you for your detailed description of SSB. Yes, I apparently have misunderstood what sidebands are, due to my comparison with AM.

With all descriptions of AM I've seen, you take a sine wave at a set frequency, say 1MHz. Then you superimpose an audio signal, say 440Hz, on that sine wave which causes the amplitude of the sine wave to vary with the same frequency as the audio signal. So far so good?

Ok, here's where I've been getting confused: If you look at the sine wave on an oscilloscope, you see it has peaks on the top and peaks on the bottom as it vibrates up and down. I have been told that the upper portion of the sine wave carries the USB and the bottom portion carries the LSB information. I've never understood how you could have peaks on the top of the sine wave without the corresponding peaks on the bottom. And, if you "suppress" the carrier (which is the original sine wave), then how can you superimpose anything on it, since if it is suppressed, it no longer exists. You're then left with nothing but the audio wave at 440Hz, which can't be sent over the air by itself.

They are the same as the Icom and Yaesu's. Looking at the back of the
radio, the two pins in the center or negative, and the two closest to the
side of the case are positive. Or is it the other way around?? No that's
right.

Alpha will sell you a new front panel for about what you could get one
made for it. It is usually just the front panel that turns to goo.
Are you sure the paint on the cover shell has gone bad too? It may
just need a good cleaning.

I had to replace the front panel on my 374A and think it was a little
over $100.

> KB9ZXO

Good radio. I think the 735 would handle 15 volts, as they are made to run in cars with varying charge voltages. But, 15 volts would be approaching the limit I would think. Myself, I wouldn't use it. The higher voltage will stress the radio a bit, and "could" cause problems later. Parts will run hotter, etc. I'd try to stay below about 14 volts. The astron would work fine, but a 25 would be a bit better as it gives you a bit of overhead. Myself, I commonly run them on car or deep cycle batteries with a charger hooked up to them. I'm running a 706 that way right now. So if you have a spare battery laying around and a charger, you have a usable supply until you get what you want. Myself, I kind of prefer the batteries. If the lights go out, I'm still on the air. MK

I go by the locking tab. If the locking tab is on the left, the two
top pins will be +. If the lock tab is on the right, the bottom two
pins will be +.
So if the tab is on top, the two right pins are +. Tab on bottom, the
two left are +. My ic-730 has the tab on the left. My 706 has it on
the bottom. I guess all will vary depending on how they can squeeze
the part in the back panel.MK

> sometimes inductors.

A linear power supply does not need a transformer as the early valve radios showed. All you need is to rectify the mains and add the appropriate filter and dropping resistor to get what you want.

So if one wishes to is pedantic about what is a power supply and what is a regulator, what is commonly called a switch mode power supply is really a linear power supply, followed by a switch mode regulator. This is not, however, how the terms are commonly used.

Even the use of a high frequency oscillator does not make a unit a switch mode power supply. This is a technique that has been used to invert supplies for many years and in the past was followed by a linear regulator. Unless you are talking about regulation, there is no need to use switches at all.

Mark.

I need a Drake AC-4 power supply so I can put my
C-Line on the air:
- Prefer working, will consider a fixer-upper.
- Not interested in hacked up or modified units.
- Not willing to pay ridiculous eBay prices.
- I'd rather not have to buy a whole station just
to get the power supply.

You can't go wrong with an Astron power supply. They're built very
well and should give you years of trouble-free service. I would
recommend you buy an RS-35. The RS-20 will not provide quite the
current capability that the IC-735 and similar rigs require.

Also, the bigger power supply would give you the capability to run not only your transceiver, but the inevitable smaller accessories you''ll end up with.

If you're talking hf frequencies, the Barker & Williamson AP-10 worked well for me in the past (see their web site). For vhf repeaters, just get a whip on a magnetic mount, and slap it on a metal surface, a pizza pan or whatever.

No problem, but do NOT try to use the amp on 12 meters, the plate choke will
go BANG!
There is no "tuned input" for 17mtrs, so the input SWR might be a little
steep.

Mark:

You did a lot of "snipping" without indicating that you did so. I recommend to anyone that, when you cut out some of a previous posting, you indicate so with a "<snip>" (good nettiquette).

I'll stick with my descriptions of "a typical linear supply" etc. They didn't cover all cases ("typical"), but I think they addressed the question pretty well. I don't agree that a "switch mode power supply" (proper terminology - I like that :-)) is really a linear supply followed by a switching regulator.

... Rich

Oh good grief!! Get an ohmmeter out. The other two pins go to
the power switch, so that it can switch on the power supply.

I hear someone was selling power cords on this newsgroup
for far less than what the manufacturer sells them for.

Sorry Rich, You're just plain wrong.

Mark you start to go astray with your examples, as a switched
mode supply might not need a transformer either, as with a dimmer
control.
But others may regulate by switching into the primary of
a transformer as well, as in a high voltage CRT supply or
with many 12v DC power supplies.

Some simply rectify the input, allowing a wide range of voltages
to be applied to the input before being switch regulated.

You were completely correct with your explanation of
on-off control versus Variable resistance for linear regulation.

The key feature of switched mode is efficiency, because
with the active device switched either on or off, it dissipates
very little power in its junction, as opposed to an amplifier
operating within it's linear region.

I have no objections to people recommending whatever they want, as long as they do not get offended if their recommendations are declined. (good manners).

Hi Mark,

I'm a 6m repeater keeper, GB3WX, in the UK.

We have tried various "White-stick" antennas, as we call them, and although quoting significant gains, the polar diagrams left much to be desired, in terms of lobes and angle to the horizontal. Gain is not everything.

What about the Cushcraft AR6 or ARX6

The AR6 is just a halfwave base fed, and the ARX6 is 2 x halfwave, although I'm a bit concerned about the quoted gain. My perceptions is that it's just a pair of "close-spaced" halfwaves in phase, and therefore the max gain will be about 1.9 dBD at best.

We have been using an AR6, for over a year now, it has withstood gales with gusts to 80+ mph and everyone in the group indicated that they were getting a stronger signal from the repeater, when we replaced the original "white-stick" with the simple half wave.

Hopefully, this will be of some use to you.

Cheers
Dave, G3ZXX.

4062. F.S.: Yeasu FT 101 ZD/FTV 901R Transverter..

For Sale or Swap:

Yeasu FT 101 ZD and FTV 901 R Triband transverter. The radio does 160-10 meters including warc bands at 110-125 watts output on all. The transverter does 6m, 2m and 70cm all modes at 30 watts. Both are in excellent condition. They both run off 110 volts. Radio comes with stock yeasu mic. I would like to get $550 for the pair or trade for nice solid state rig. So tell me what you got....

4064. Help HP-616B generator problem

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-26 13:40:05 UTC
From: Dave Bullock <DaveB@ihr.mrc.ac.uk>
Message-ID: <3CA07A35.4DA64AE1@ihr.mrc.ac.uk>
Source record: 45569

Help!

I recently bought an HP 616B signal GHz generator to help
me with building my 13cms station. The generator looked in beautiful
condition and so I was happy to spend my money. (yeah I know fool and
his money etc.)
Sadly when I got the generator home I found that there was a valve
missing, it is one under a metal cap at the left hand side of the long
cavity. Also there are wires going through 'feed thru's' in the cap and
these are just hanging inside!
Was there a special connector on these ends or do they solder onto the
valve directly.

Can anyone help me by telling me what is missing, and what the valve
type or number is?

Do you have any circuit data?

Thanks in anticipation......

Dave G6UWO

The unit is an all mode radio HF, with Desk Mic MD-100,
Hand Mic Yaesu, Remote faceplate, Remote faceplate holder, Remote faceplate cable, Mobile bracket and manual. Orginal cartons and radio are all packed in large heavy gauge box. I pay shipping and insurance. The condition is like new (mint). I used it for one year and then it became a backup radio to an FT 920 and FT 1000 mark V. It has the CW filter still in the box, not installed. The unit has Collins filter built in. Everything works fine. No repairs, no mods.

Money order for amount on ad or certified bank check and I will ship same day.

The AR-6 is a well-built, sturdy antenna. The problem
in using it for a repeater is that it has uptilt rather than
downtilt.

4072. Assembled K10+ Memory/Beacon Keyers

I haven't tried one of those, but is probably a decent antenna.

Another good thing about the AR-6 is it's quite adjustable for the
freq used.
They also make a 10m version. "AR-10". These are easily homebrewed
also. I've made a few of them for 10m. I use a single turn loop at the
base the same way cushcraft does. The cap made from coax. You can also
improve the low angle performance a bit by adding a decoupling section
below the antenna to reduce the feedline radiation. I used a 1/4 wave
section of coax below the feed to a set of 1/4 wave radials mounted
and grounded to the mast a 1/4 wave below the feedpoint. I tried this
on a 10m version and it did seem to clean it up a tad. But they work
fairly well out of the box with no decoupling. MK

Wow, that's a pretty broad statement, Jim. How so?

I've built quite a few linear supplies, and I'm pretty sure my
description of "a typical linear supply (as used by Hams)" is correct.
How is it not?

And I've torn apart a few switching supplies :-) for which I'm also
pretty sure my description is correct. So again, how is it not?

... Rich

Ok, so let's get back to matters that are not just a matter of opinion.
If I misunderstand the differences between linear and switching
supplies, I'd like to be corrected.

Now, granted that these are not definitions, but:

Most of the linear supplies I have seen (and built) began with a
transformer to set (approximately) the output voltage. The only
exceptions were a few somewhat dangerous designs used mainly in older
equipment that produced outputs in the vicinity of 120 V. The
transformers are invariably followed by diodes or a diode bridge and
some filtering.

The switching supplies used no input transformer, set the output voltage
by some combination of pulse-width modulation and a step-up/step-down
toroidal transformer, and followed that with filtering and more
regulation.

What's wrong with those descriptions, other than being very simple and
not all-encompassing?

... Rich

In the most simple terms,

a linear power supply has the regulating device in its "linear" region of operation,

and,

a switch-mode power supply has its regulating device "switching" between on and off.

The rest being just details of the particular design.

Source record: 45593

Does anyone know if there is a software program to use with the above rig
for proramming frequencies , etc ??

Either the ADM software, or otherwise ?? Can one rig be **linked** to
the other for cloning data, like the VX-5r can be done ??

4089. Need info/advice: installing 2m/440MHz radio in 2002 Xterra

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-27 00:54:15 UTC
From: Bob Myers <rjmyers1@gte.net>
Message-ID: <3CA134DF.6AD6F3BF@gte.net>
Source record: 45592
Cross-posted to: alt.autos.nissan,rec.radio.amateur.equipment

I would like to install a dual band ham radio inside of my Xterra.
I have a few questions about doing this -- hoping that someone out
there has already done it and/or could offer some insight...

1) Is there any easy way to get the power cable for the radio to run
from inside the car directly to the battery, without much trouble?
I understand the need to go directly to the battery to prevent possible
wiring "meltdown" issues if I try to use the passenger compartment
fuse box.

2) The manual says to keep the antenna away from the ECM module.
This module is located directly behind cubbyhole area, on the floor.
Is there really an issue with having the radio sit in the cubbyhole
area?

Any suggestions on how to mount the radio is welcomed. I have
a Yaesu FT-90R radio that will easily fit in the cubbyhole,
since it's about 4" wide.

thanks,
bob

hey bob
what i would sugget is take your truck to a local CB or audio shop that
does installations they know all the tips and tricks to getting thru the
firewalls
as for the ECM modual
you want to steer clear of that it can be very suseptible to RF and the
last thing you want to do is scramble the brains of your truck if i
remember correctly the FT90 has a removeable faceplate so mount the radio
in the back or under your seat somewhere aways from that modual and route
your coax as far from it as possible if you can mount that radio in the
back end somewhere you may be able to get your 12v source there as well and
all you will need to run up front is the data cable from the radio to the
faceplate mounted up front with you sonewhere visible
good luck

I don't have an Xterra but in my '99 Maxima the computer is between the driver and passenger against the firewall. I have a Kenwood 742A with modules for 440, 221 and 2 meters mounted under the passenger's seat. The coax runs down the channel under the doors into the trunk to a 3 band gain type antenna mounted on the edge of the trunk.

I have absolutely no indication of any problem with the computer when I transmit on any of those bands with the full power available. And, as it is pointed out, though I know better, I power it with a direct connection to the "cigarette lighter" and it seems to work fine. I just didn't have the energy at the time to try to figure out how to get into the engine compartment without drilling a firewall hole!

When I unplug the connection to the power, put the mike between the center console and the passenger seat, and remove the control head that I mounted on a block of wood that fits into the pull out box on the dash and stow it in the glove compartment (in a large sock) you can't tell that there is a radio in the car. The cable for the control head comes out of the lip of the glove compartment.

You might want to try the rig with whatever antenna you intend to use and temporary power to make sure you aren't placing it where it might cause a problem. With a 1970s AMC Hornet years ago my IC-245 (only 10 watts on 2 meters FM and SSB) would cause the speed control to act up.

4104. 3-electrode Tubes

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-27 04:11:18 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <a7rgrr$n5rb5$1@ID-124126.news.dfncis.de>
Source record: 45508

NOW AVAILABLE:

New Program, albeit belated, "TRIODE1.exe"

Program TRIODE1 assists with the design of triode, grounded-cathode, RF power amplifiers from 1 watt to any arbitrary large RF output power. For "anode" Americans can read "plate". For "tube" much of the English-speaking world can read "valve". (For grounded grids another program is needed.)

Tube operating conditions can be selected at 1 degree intervals from Class-A, via Class-AB1 and Class-AB2, to Class-C. In other words from anode current operating angles from 360 degrees down to very high conversion efficiency at 45 degrees.

The program first accepts a manufacturer's basic tube data: Mu = Amplification factor, Perveance which is related to cathode electron emission and equivalent conductance, and alpha, a value which defines the curvature in a tube's current-vs-voltage characteristics. The fraction of cathode current intercepted by the grid, sometimes neglected, is also taken into account. But if one or two parameters are unavailable all is not lost.

The program user can then enter his own operating conditions such as DC anode supply volts, amplitude of grid and anode RF voltages, intrinsic Q of the tank coil, output circuit operating Q and, of course, anode current operating angle and operating frequency. Operating angle is a little known but vital factor which a circuit designer must not neglect. It profoundly effects circuit operation by controlling a tube's internal resistance.

It may not go unnoticed there is no reference in the program as to what the internal resistance of a tube might be. Or to matching an amplifier's internal resistance to its load for the purpose of maximising power delivered to that load.

Computed output data includes DC anode current, DC power input, anode dissipation, conversion efficiency, DC grid current, DC grid bias, grid bias resistor value, grid operating angle, grid dissipation, and grid RF drive power required to satisfy the assumed operating conditions. (A common design

feature not covered by the program is deliberate dissipation of RF drive power in a damping resistor to improve operating stability. However this does not effect basic circuit design.)

The output circuit may be either a simple tuned tank circuit with a link coupling to a 50-ohm load, or a Pi-matching circuit. All coil and capacitor component values are computed. It is left to the designer to take parasitic tube and circuit capacitance and inductance into account. For coil dimensions, number of turns etc., refer to program SOLNOID2.

If a user should be unfamiliar with the characteristics of triode electron tubes this program will be found to be of educational value. By hitting one or another key the essential data for two types of tube can be entered ready for experimenting. But a set of anode/grid currents versus anode/grid voltage characteristics of any triode tube is essential.

There is a brief introductory note on each parameter used in the program. It may be of passing interest the basic mathematics are equally applicable to that much later 3-terminal amplifying device - the transistor.

On the other hand, for people who prefer the simple life, program TRIODE1.exe can be used just to calculate L and C values of a Pi-matching network to be used with a 3-500Z or any other power amplifier.

If Terman, Everitt, et-al had had this program available in the 1930's they would have got along much faster. ;o)

Download TRIODE1 from website below in a few seconds. One self-contained binary file only. Not zipped up. No unzipping inconvenience. Run immediately. All in plain English. Old timers can find out where they went wrong.

Sorry that's what it is on the TS130 and some others, and is in the
cable with some of the base station power supplies.

Nice to know if you plug in different radios to the same power
source.

It could be worse. I use a FT-530 for my alarm clock. When I sent it
back to Yaesu I left the volume all the way up and the alarm still
on... I'm sure it bothered SOMEONE along the way, probably more than
once!

Hello I got MUCH, MUCH, MUCH more stuff 4 Sale.....

I will be bringing all this STUFF to the TRW Swapmeet in Redondo Beach, CA. on Saturday 03/30/2002. My spot at the swapmeet is E-1.

Directions to the swapmeet Take the (405) Freeway , which is the San Diego Freeway , and exit on Rosecrans Blvd. It is THREE (3) exits south of Century Blvd. which is the exit for LAX, go WEST three signal lights to AVIATION Blvd. turn LEFT going south go another two signal lights to Marine, the swapmeet is just 100 yards south of Marine of the left side of the street on the east side.

" HOPE TO SEE YOU ALL THERE.....73"

The swapmeet is from 7:00 A.M. - 11:00 A.M.

Collins PM-2 power supply $195.00

DX Engineering Voice Processor for a Collins 32 Transmitters....$275.00

Collins 270G-2 External Speaker.....$285.00

Yaesu FV-401 External VFO nice condition with connecting cable, and manual $59.00

Yaesu SP-401P with manual nice condition $39.00

Yaesu Landliner LL-301 phone patch......$29.00

Yaesu MH-15CB DTMF hand microphone.....$25.00

Yaesu FV-102DM External VFO $149.00

KLM 160 watt VHF 144 amplifier 10 watts in 160 watts output $89.00

AEA PK-88 TNC with manual $40.00

Henry Radio 3K stand up console amplifier with tear drop meters, one missing with manual wired for 220 volts, not tested , as is , pick up ONLY Los Angeles.....$269.00

Swan 350 with Electro-voice 727 desk microphone, and matching Swan 117-C power supply and power supply with manual works Great.....$139.00

Gonset GSB-201 desk amplifier runs 4 - 811's with manual wired untested (pick up only Los Angeles) for 110 volts $240.00

Gonset G-50 6 meter transmitter untested.....$49.00

Multi/Elmac AF-68 Trans-Citer untested with power supply..... $59.00

Multi/Elmac PMR-8 (I have TWO) untested .....$26.00 each

Eico 625 Tube Tester with tube chart.....$75.00

Heath-Kit "THE TWOER" in EXCELLENT a COLLECTOR item for sure with the AC/DC cable, and original heath-kit microphone $99.00

Heath-Kit HW-22 SSB Transceiver with original Heath-Kit microphone, mounting bracket and matching Heath-Kit power supply.....$125.00

Heath-Kit AM-2 wattmeter.....$20.00

Micro-Match (vintage) # 262 RF Power/VSWR meter...$75.00

Autek Research Message Memory CMOS Keyer MK-1.....$75.00

Palomar R-X Noise Bridge.....$35.00

Palomar Tuner/Tuner PT-340.....$55.00

Alpha Delta Delta 4, 4 position antenna switch.....$45.00

B & W # 595 6 position antenna switch.....$30.00

Courier Port-A-Lab 500 wattmeter/VSWR/Modulation/Relative Field Strength Meter.....$39.00

Maxon (TWO) CS-0510 4 channel handhelds with swivel cases (can't test do not have a charger) Both for $55.00

Yosan HJ-502 "NEW IN THE BOX, NEVER USED"
WITH INSTRUCTIONS, AND ORIGINAL BOX
Power/VSWR/Modulation/ AND a frequency counter.....$85.00

Icom SM-6 desk microphone with original box....$45.00

Icom BC-35 quick charger for the BP-7, BP-8...$40.00

Astatic D104M-6 chrome hand microphone...$25.00

Astron RS-20A needs new Positive +, Negative - posts put on ...$45.00

Ameco PLF-2 Preamplifier.....$25.00

Kenwood SMC-25 speaker/microphone for the TR-2500, TR-2600...$20.00

Kenwood MC-50 desk microphone with box & manual $50.00

Kenwood R-599D Receiver works, and looks Great with manual $130.00

Kenwood T-599D Transmitter was tuning OK, and then stopped . Nice condition with manual $89.00

Kenwood MC-50 desk microphone with manual $50.00

Kenwood YK-88CN 270HZ C.W. filter on 8830.7 KHZ.

This filter will fits these models:
Kenwood TS-130S,130SE,430S,440S,530S,530SP,830S,670S,660,and
the R-5000. .....$60.00 shipped in the U.S.

Kenwood YK-88C 500HZ CW filter on 8830.7 KHZ.
This filter will fits the following models:
TS-120S,130S,130SE,430S,440S,530S,530SP,670S,180S,830S,660,
& R-5000..... $60.00 shipped in the US.

Kenwood TU-4C (new in the box) is the Tone Encoder for the Kenwood
TW-4000A 144/440 MHZ dual band mobile radio $45.00
shipped in the U.S.

KENWOOD CK-18 WARC BAND COIL PARTS KIT FOR THE TS-180S (New In
The Box),(UNUSED) This will add 12, 17, 30 meters to your Kenwood
TS-180S, instruction manual included.....$65.00 shipped in the
U.S. ONLY

Kenwood IC-10 (set of two chips) these are required for computer
control when using a Kenwood TS-440S, and R-5000
.....$49.00 shipped in the U.S.

4109. VX-5R Transmission power at 477MHz?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-27 07:05:45 UTC
From: Sam.Yang@csiro.au
Message-ID: <4b8ff9bc.0203262305.f56ac44@posting.google.com>
Source record: 45513

I am intended to buy a Yaesu VX-5R and modify it so I can use it as a UHF CB in Australia. The CB band is in 476.425 - 477.400MHz. The information I get relating the above is mixed: Some people said that the output power is as low as 30mW whereas others claim that it can transmit upto 4W. Had anyone actually measured the output power at 477MHz?

Regards,

Sam Yang

You just need 3 connections....audio, PTT, and ground. I usually use the
little test leads with a small alligator clip on each end to narrow it down.

I suspect that both of my TS-430 radios came with mobile power cords.
Possibly the cords for base station use have these connections for use
with the PS-430 power supply. I have no Idea actually as I use a
different power supply.

WB8OWU wrote:
>
> I need an external VFO for the TS-520 Transceiver. Email abrenner@qmpwlaw.com

I generally see them at ham swaps. You can also use the same VFO as the TS-820. That's what I have on my '520, and it works fine. I believe I paid $75 for it at a swap. Dayton is coming up - betcha there will be a few available there.

73 - Bob, KI8AB

(the outboard VFO is absolutely *essential* for working the current DXpeditions split - I wonder if that's why you are currently shopping.)

4116. Early Drake TR4 Schematic

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-27 16:02:55 UTC
From: Carl Strode <crstrode@webbworks.com>
Message-ID: <3CA1ED2F.A16CB45B@webbworks.com>
Source record: 45520
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

I need a schematic for an early TR4. Serial number 16000 series. This unit has the original
factory inspection tag still
attached with a 1965 date.

I Currently have three (count 'em -three) schematics for the TR4, none of which match mine.

I downloaded the one from BAMA (19500), and have one in an original Drake manual. The one in
the manual does not have a
date code at the bottom, but at least it has the 6HS6 at V4, so it is probably close. I also
have an original schematic
with a code for the 27000 series TR4.

Those guys at the Drake factory must really have been earning their keep! It seems like they
were cooking up a new TR4
design each month!

Please help - next stop is the looney bin.

Carl WA7CS (wa7cs@arrl.net)

4121. Tech. Help/Radio Shack HTX-404 & HTX-202 / Backup Battery Replacement

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-27 20:44:59 UTC
From: Raymond Miller <radioman@localnet.com>
Message-ID: <3CA22F4B.A06CDD27@localnet.com>
Source record: 45524

Hello,
It is the timr when the backup batteries on each of my familys HTX-XXX radios are becoming tired.
Extended warranty has lrun out on the last one, so I am in a bit of a problem. Assumingly, both the VHF & UHF are essentially the same inside,

the proceedure for the replacement of the backup battery should be identical.

My problem, is there anyone with a service manual willing to scan the proper pages for me and send them to me a a file so I won't be going in there blind?

Also, any hints, tips, tricks to help me out in this job will be greatly

appreciated.

45dB gain with four elements?? Good trick if you can swing it. Best I've ever seen with just four elements is about 11dB.. and that was a really tight bandwidth.

Yeah...JoGunn has always exaggerated their gain figures. I use one of their other models on 10 Meters. They do quite well...but aren't cheap. Very well made though! Rugged!!!!!

4125. Icom IC-735 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-27 21:36:16 UTC
From: Chris Singleton <ke3mc@qsl.net>
Message-ID: <4Zqo8.1097$mY2.13947@news.abs.net>
Source record: 45529

I recently purchased an Icom IC-735 in mint condition- all except that the TX section has an oscillation when transmitting on high power- all bands, antenna or dummy- doesn't matter. I also noticed that if I tune my external tuner so that there is a slight amount of reflected power, the oscillation effects decrease a little. Some fellow hams have suggested that maybe the electrolytic Caps have dried out in the PA circuit??? Anyone else had any experience with this rig, before I go "shotgunning" these parts?? The PA board is a little involved to get out as it has all of the transistors attached to the large heat sink which must be unscrewed, etc... The rig was previously used as a RX only unit (so I'm told), so dried out caps from lack of use in 10 years sounds reasonable, but I'd hate to tear the PA section apart just to find that the caps are OK. Please help!!!

Chris Singleton, KE3MC

4126. Re: VX-5R Transmission power at 477MHz?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-27 22:27:50 UTC

Message-ID: <qHro8.289$Ho1.6728@news1.fdn.com>
Source record: 45530

Is it possible that at this freqency, the antenna is a bit mis-matched, has a high SWR, and it automatically cuts the outpout power to protect the finals ?? Just a thought.

73 de Jim K4PYT

I am intended to buy a Yaesu VX-5R and modify it so I can use it as a UHF CB in Australia. The CB band is in 476.425 - 477.400MHz. The information I get relating the above is mixed: Some people said that the output power is as low as 30mW whereas others claim that it can transmit upto 4W. Had anyone actually measured the output power at 477MHz?

Regards,

Sam Yang

You want simplicity?

If the pounds per watt ratio is high, it's most likely a linear supply
(barring some line operated designs), if the the pounds per watt ratio is
low, it's most likely a switching mode. :)

What do you mean by oscillation? A spurious rf oscillation, or an
audio feedback type problem on phone? Is this all modes, or only CW,
SSB, etc? It's hard for me to tell what the problem is by your
description. My gut hunch would be that the caps are ok, but who
knows...It may be in an earlier stage. Also you may have an local rf
problem although going to a dummy will usually be a good check for
that unless the patch cable from the rig is the problem. MK

Hello,

I have several of this antique globe shape German triode in stock. It is directly heated, an European 4-pin base and about 12W anode dissipation. The heater is 3.8V 0.72A, u=17, S = 3.0mA/V Max. anode voltage is 400V. The valves are NOS, but the boxes are mostly in bad shape. Pictures are available by e-mail.
Please contact me if you are interested.

Carl

It is always worth checking Drake's web site for availability of
manuals. I managed to get an original manual for an early 1970s
receiver from them a few weeks ago (and cheaper than photocopies
offered on the net). In your case I had a quick look but they are out
of stock of the TR4 stuff.

Elecraft is coming out with a 100W PA option for their K2 soon. It is
internal, so the K2 becomes an all-in-one 100W HF rig.

Now that's being practical ... getting down to brass tacks!

I'd also note that if it makes your rig hum, it's probably linear, and
if it makes raspy noise, it's probably a switcher.

Thank goodness I found a better kind of supply many years ago. They
sell them in the Sears automotive department ;-)

Come to think of it, mine does the same thing. I'd assumed it was because
at theses low volumes (mine puts out zero audio from fully counterclockwise
to somewhere between 1/8 and 1/4) there wasn't enough power to run the
speaker.

I don't have a 706, but in playing around with another rig brand, I notice if the RF gain is turned too low, not much happens early in the travel of the AF gain. You might check your RF gain, and make sure it is high enough.

Hi all, I have the above listed HF amp, it's doing about 450w output thru 4 6LQ6 tubes. It is in good condition and has the 10m option installed. Does 160-10m. Has been checked by a tech and is working properly. Has had power switch replaced before I acquired it and it is not the appropriate switch, otherwise good condition.
Not really sure about shipping this thing as it is very heavy and I've never shipped an amp before so I'm just fishing around to see if anyone is interested. Includes amp and copy of manual. Priced at $300 shipped CONUS.
thanks and please email direct.

Just got a used IC706 (early model) that has the FL232 installed but the filter doesn't work I did the initial setting selection for both narrow filters but nothing happens when I put the rig in NAR CW mode. Now on the IC706, and in the manual, the only filters mentioned are the FL100 and FL101 narrow CW filters. Is it possible that the FL232 will not work in the older IC706 but does work in the newer 706 MK II models?

>
> 73.... Chris Singleton, KE3MC

It's hard to say really without seeing it happen. My first thoughts
would be that rf was getting back into the rig via feedline shield
currents, etc. But usually going to the dummy load should cure it if
thats the problem. RF would cause the high drains, output spikes that
you are seeing on SSB. But, usually rf doesn't hurt the CW section
unless it creeps into a keyer, etc. There is one thing it "could" be.
It's possible that in the past someone tried to readjust the power
output to try to get more power out of it. You said he didn't xmit, but
maybe someone else owned it before. In that case they may have adjusted
the ALC theshold inside the rig to pretty much disable the effects of
the ALC. If this is the case, you will see little if any ALC indication
at full power CW or SSB. "meter set for ALC". If you see ALC indication
of some type when talking on SSB full power, you should be ok, but if
when talking at full power, you don't see any ALC indication, you will
have quite a bit of distortion on peaks. And if the rig is set this way,
and then you get a bit of RF back into the rig to boot, that can cause
the type thing you describe. If it does do this, just roll the RF PWR
back a hair until you start to see an ALC indication. Then see if you
still have the problem. In this case the front panel control is being
used to correct the incorrect setting inside the radio. You can then go
in and reset the level back to the proper specs. This is just a "theory"

that "could" cause a problem as you describe. May not be the case at all....Just a guess...

It sounds like you are doing about normal power. Most do 90-100 watts. Depends on the P/S voltage and how well regulated the supply is. Hope you get it ironed out. It doesn't sound overly serious, but those type things can be a hassle to track down sometimes.
That it seems ok at lower powers, also adds to the possible rf problem possibilty. That will usually be the case with rf. I haven't had a 735, although I do have a 730 which is similar. You might try different patch cords/ lengths to see if any problems with the cords. Also make sure the wiring to the rig is large enough to handle the current, and that the fuses/fuse holders are making a good connection with no resistance due to corrosion, etc. I posted this back to the NG in case anyone else has any ideas. GE Portables

GE MPA VHF 146-162 full system keypad. Radio is as new and is almost perfect. The only flaw is the grip tape under the PTT button is peeling at the edges. Otherwise perfect. The next feature is, The radio is Key pad programmable. 16 channel scan and front face programmable. Has a like new battery and a good rapid charger. Also a belt clip. $500.00
GE MPA VHF Select 157 - 174 split. Nice radio 9 condition with battery and standard charger. I have it programmed down to 154 MHz with no trouble but will go no lower. $200.00
GE MPA UHF Scan. 440 -470 split. This radio is a little shiny on the edges but not
bad overall. About an 8. 192 channel Alpha-Numeric display. With battery and charger.
I have this on the ham band and works great, I have been using this one all week to talk on. $225.00
GE MPD UHF select model 440-460. 48 channel alpha-Numeric display. programmed on the 440 ham band and works on the local repeaters and GMRS. With Battery and standard charger. Nice 8 - 8.5 radio. $100.00 Also have 1 in about a 7 condition $90.00
GE MPD select model 470.- 488 MHz. 48 channel Alpha-Numeric display. With battery and standard charger. 7-7.5 $90.00
GE MPD Scan UHF 440- 460. 48 channel Alpha-Numeric display. Also programmed on the hamband for testing. Works on the local repeaters and GMRS. with battery and standard charger. $125.00
GE MPD scan VHF 150.8 174. 48 channel Alpha-Numeric display. These look good and come with a battery and standard charger. 135.00 each.
MPD Voice Guard VHF system model with full keypad. 48 channel alpha display. with battery and standard charger. $140.00
GE PCS UHF 8 channel. I have this radio on the uhf ham band for testing and it works the local repeaters. with battery and charger. $95.00
GE MPS VHF Like new 10 channel. With new battery, new antenna, and a standard charger. $65.00
GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00
GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $225.00 all 3 radios.

GE Mobiles

GE Phoenix SX VHF 16 channel with dual priority scan. Grey case with mic, speaker, and power cord. Tested working. $75.00 each. I have 2 complete.
GE Phoenix SX VHF 128 channel scan. No accessories. Has all 8 proms. $100.00
GE MVS UHF 16 channel scan. With Mic, Bracket, and power cord. $125.00
GE Mastr exec II VHF 75 watt mobile complete with accessories. $60.00 each
GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each
GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00
.GE Ranger VHF 150.-162 100 watt mobile. Complete with cable, Mic, speaker, and S550 control head. This is a great public safety mobile or can be tuned to
the 2 meter ham band. $175.00
GE S990 head. Looks new but I have not had time to test this yet. $75.00
GE S550 head 16 channel looks good but not tested. $35.00
GE Mobile Vehicle Adapter For MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com) With mic, speaker,
and power cable. $100.00

GE Accessories

Mastr II control cable. $8.00 each
Mastr II head for mobile repeater operation. $5.00
Mastr II Mic. $5.00
Mastr II 8 channel tone boards. $5.00
Mobile Repeater cable for Mastr II. $10.00
Mobile Repeater cable for Delta or Ranger. $30.00. I have seen programming cables made from these.
GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2. If you buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.
GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each. I have 2 sets of EC/5C UHF icoms left and I bought 7 sets of 2C UHF Icoms = $30.00 per set. I have 5 sets of these left now.
GE Delta cables. These are the downloading type used with the S820 heads. $40.00 each
Delta mounting plates. $10.00 each
Ranger mounting plate. $15.00
GE S-550 / 500 and others mounting brackets. $5.00 each
GE MPA, MPD, MTL public safety mic. $35.00 each
GE MPA, MPD, MTL standard Speaker mic. $25.00
GE PCS Universal Rapid charger. $35.00 each
GE MPA standard chargers. $20.00 each
GE MPA Rapid chargers. $30.00 each
GE MPI desk charger with wall transformer. $10.00
GE MPI Rack charger, 8 position. 25.00
GE MPI Mobile battery charger, Rare. $20.00
GE Battery discharger analyzer. For MPA, MPD batteries. Attaches to a rapid rack charger with a DB 15 cable and uses a MPD body to attach a battery to.

Has LED readout in display area of MPD body to tell discharge rate. Another rare GE goodie. $45.00
GE shoulder strap like new, attaches where belt clip is. $15.00
GE Belt clips. $10.00 each
GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card and power supply / speaker. $300.00
GE Duplexer part number 19C-307166-P1. Model DB-4075. This is the standard MastrII
Duplexer found in the MastrII cabinets. With the harness. $125.00

Other Radios and Accessories

Icom 3200 a Dual band ham radio. Has box and manual but no mounting bracket. Has tone squelch board installed. $225.00
Icom 24AT Dual band ham radio. Has wall charger and manual. Very nice radio, And
will get the whole 800 band. $175.00
Yaesu FT50R Nice like new radio. In the box with 5 watt battery. All Items in plastic
bags in the box with the warranty card. Dual band ham radio. 110 channels and I think this radio is old enough to get all 800. $195.00
Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland. $75.00
Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00
Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00
Motorola P200 VHF 136. - 150.8 high power. New battery and charger. 2 channel but can be made into a 6 channel easily. This would be a great ham radio. $115.00
Motorola Mitrek VHF high 110 watt drawer only. $50.00
Motorola Adapter for MX radios for the 1801 suitcase programmer. A and B prom. $175.00
Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all
Motorola UHF Convert-a-com Amp. 5 in 40 watts out. $45.00
EF Johnson 242-8600, 800 MHz LTR I have 4 of these. $25.00 each
EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00
Kenwood TK 940, 800 MHz dash mount radio. $100.00
Uniden SMS 825 ts, 800 MHz Dash mount radio. $75.00
MRC 100 Repeater controller in rack mount. $100.00
Voter from IMTS phone system. 2 rec and 2 tx cards. $40.00
Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00
Antenna Specialists on glass 440 antenna. New old stock. $22.00
Antenna Specialists on glass 220 antenna. New old stock. $22.00

Consignment section

This area is for a few friends who like those other radios you know "Motorola" They are good people and I will pass along any trades you may wish to make.
Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete. $425.00
Motorola Maratrac VHF 100 watt 16 channel head, Never mounted in a vehicle.$375.00
Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each
Motorola HT1000 Intrinsically safe, Re-cased looks new. 16 channel scan with charger. $425.00
Motorola P200 UHF high power. 6 channel. $150.00
Motorola MT1000 UHF 16 channel scan. $250.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, anything you have extra. MPA or MPD portables what do you have and what do you want for them?
Johnson scorpion program cable. PSX200 UHF mobiles.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. If I think it may be bad I will not list it. I take cash, Postal Money Orders, Paypal, and checks but I hold them for up to two weeks to clear before I ship. If you have a question E-mail me.

That is right...there is NO match. Others have posted YO-301 as a match for the FT-1000mp but it is not, so don't let these bottomfeeders try to charge ridicules prices for Yaesu scopes that are over 20 years old. The 301 series was 1st made in 1976.

Hi all, Does anybody out there have an instruction sheet for the
Lafayette
HA-115 compressor amplifier (mic audio preamp).
I would be glad to pay for one or a copy of one plus mailing costs.
Even a scanned copy sent via e-mail of it would be great!

THANKS, Mark

4176. REQ: PK232 Radio > Tnc cables

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-29 19:10:52 UTC
From: ZR1TRD <trd@telkomsa.net>
Message-ID: <a82e6t$e3p$1@ctb-nnrp2.saix.net>
Source record: 45481

Hi All

Below a request from my friend Ron, are you able to help ?

Many thanks.

Andr&#65533; ZR1TRD

From: ZS1RON@ZS0FIK.FIS.WCP.ZAF.AF
To : PACKET@ZAF

I need the cables that connect the TNC Radio 1 and Radio 2 ports to
the respective radios rather desperately.

These cables have five wires that connect to a flat multi plug that
is plugged into the back of the PK232 TNC on the one end and, are connected
to a microphone or FSK DIN plug at the other end, for conveying data between
the TNC and the radios.

Anyone who has these cables surplus to requirements and who wants to
swap them, I need to hear from you ASAP.

I have been using the PK232MBX for digital communication for a
number of years and the "flat" 5 pin plugs are the worse for wear
and in need of replacement. Are you able to help?

Source record: 45482

The post was not directed to you. What makes you think it was? Do you get a band scope? I don't think so. If some one wants to spend $300 plus that I have seen from bottom feeders to see incoming pattern...that is their business. But for anyone to claim the yo-301 is a match for the FT-1000MP if ludicrous and foolish. The patterns seen on your 301 can be seen just a easily on a computer with a sound card and you get a BAND SCOPE also. Your message posted to the original post "Yaesu BAND SCOPE" is misleading and you do not have a band scope.

Do a search for Timewave. They sell external DSP;s and they took control of
the PK232's when AEA when bankrupt. They sell the cables you are looking
for as when as make cables with the proper connectors for your radio.

I have a few new,fully assembled K10+ iambic keyers for sale. All commands
are entered via your paddle & there are 24 commands that can be used.
Message memory is 95 letters in four slots with embedded commands,
speed range is 5 to 59WPM, beacon interval of 1 to 59 seconds & many
other neat features. For more info you can check out my site at
http://www.mygem.net/rapco/ It is set-up for positive keying. $39.95
shipped in the U.S.
Thanks for looking,Lew.

4185. Will this antenna work?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-29 23:09:43 UTC
From: Bill Walker <kwalker@earth1.net>
Message-ID: <ua9sjnm6rse677@corp.supernews.com>
Source record: 45490

My shack is in my attic. I would like to run a wire from there about 30' height up to the top of the one and only tree on my property about 60' up and 75 feet distance and then down to a post in the far corner of the property, say 8 to 10' high and roughly 150 feet total distance. I thought of making an inverted vee fed at the center atop the tree, but the length of the coax would be too much. If I feed an antenna as I described at the attic end -- sort of an inverted vee fed from one end -- what kind of pattern should I expect? Would it radiate high or low? I would provide a good ground system of say two or three 8' groung rods just under my attic window. The antenna would be running almose east-west. Another question is: can a ground system that is thirty feet vertical distance really provide a good ground?

4186. Re: Will this antenna work?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-29 23:23:39 UTC
From: Paul Coverdale <coverdale@sympatico.ca>
Message-ID: <3CA4F77B.CC5AC2AE@sympatico.ca>
Source record: 45491

This antenna should work fine. It will have the same radiation pattern as a conventional centre-fed inverted vee. The only difference is that the feedpoint will be high impedance.

Paul, VE3ICV

>I did the initial setting selection for both
> narrow filters but nothing happens when I put the rig in NAR CW mode.

This is your problem. The FL-232 filter is an SSB filter not a CW filter. If you install the FL-101 CW filter you'll get narrow band CW mode filtration.

Message-ID: <3m8aau0untr876h6afbvi6c3ruso9e5kce@4ax.com>
Source record: 45401

I am pretty sure the " volume control " is not carrying audio but a digital signal to a audio attenuator. Most of the products I have seen using this scheme has a " dead " area in the first few degrees of turning the volume knob.

Hi All,

I have an Icom IC T8A HT that is about 3-4 yrs. old. Never any problems at all until recently. I had been using it with a mobile mag mount antenna, running it in low power mode (0.5 Watts) with very good results. All of a sudden, almost no power output. You can hear key up on a nearby TX but shows nothing on a watt meter. I have tried a CPU reset. Any ideas, besides keeping it for receiver ?? Thanks in advance for any help.

Hi Rick
You either broke the connection to the board on the inside of the antenna connector or you blew the PA Module.

Andre, your friend can get those cables from the company that took over the products of AEA, which is called Timewave. The website for them is :

http://www.timewave.com/

Then, click on Customer Support, then click on Accessories, near the top of the page. The cables with the 5 pin plugs can be bought and then you put the radio-end plugs on them, or they will take a special order to make up cables for your radio.

I hope this helps !!!!!!!!!!!!

>I thought of making an inverted vee fed at the center atop the tree,
but the >length of
> the coax would be too much.

This would be the best antenna by far. I wouldn't worry about the
length of the coax. On HF, the losses are very low. You could have 500
ft of 213 and not see too much loss on the lower bands. Also being the
antenna is away from the house, and center fed, you would have much
less rf problems around the house.

If I feed an antenna as I described at the attic
> end -- sort of an inverted vee fed from one end -- what kind of pattern
> should I expect? Would it radiate high or low?
Well, like one said, the pattern doesn't change much, but you will
have a high impedance feed, which will need to be matched. This will
add loss. Also the antenna is not balanced, so feeder currents will be
a problem. Call me picky, but I don't like end fed horizontal wire
antennas. Only as a last resort will I use those.

I would provide a good ground
> system of say two or three 8' groung rods just under my attic window. The
> antenna would be running almose east-west. Another question is: can a ground
> system that is thirty feet vertical distance really provide a good ground?

No. Not at the shack. This is another advantage to the center fed
dipole. It needs no ground whatsoever to function properly. All you
would need to worry about is possible safety grounding in the shack,
and whatever lightning protection you want to use. The ground rods
outside will be more useful as a lightning ground return than rf.
Worrying about an rf ground at the shack is a waste of time unless you
plan on feeding a random wire from the shack itself. And I normally
don't recommend that. MK

> de AB8LR, Chris

Mine doesn't either. It's possible maybe they pressed his on a bit close to the faceplate.??? I think the knobs just press on and off. I don't believe there is a lock screw. "I'm not 100% on that though, be careful!." Maybe he could just pull it out a hair until it quits dragging. It might be rubbing on the faceplate plastic a bit. I thought maybe there was felt behind the knob to kill the friction, but I'm not sure.?? Maybe the felt is missing??? MK

4204. Motorola Factory Original Program Rib Boxes (Not Clones)

Hi:

Are you having problems with a Clone?

Ever Corrupt a Radio with a Clone or a Wanabe replacement?

If you are looking for a Motorola Factory Rib Box, I do have some that
are in Mint Condition. I can supply them Complete, or in individule parts,
but you get a better deal as a package.

Most of these have only been used a few times, and then placed back into
the Anti-Static bag.

Here is the prices:

For a Complete set up including the Original Factory Motorola Rib Box, Original
Instructions, Factory Power Supply, Rib to Computer Cable, Duracell Battery,
and box.

$235.00+ S & H
http://www2.4dcomm.com/metrotech/m_ribox.jpg
==========

If you want Just a Rib Box
$179.50 + S & H
Photo: http://www2.4dcomm.com/metrotech/rib_box.jpg
==========

Original Instructions with parts list and diagram
$ 3.50

If you need a Pro-Made Rib to Computer Cable
$34.00+ S & H
Photo: http://www2.4dcomm.com/metrotech/r_to_c.jpg

This is made better than Motorola, has Heavy Duty Cable Supports at both
ends, also I removed one shell half so you can see the detail wiring
==========

Motorlola Factory Rib Power Supply
$24.00 + S & H
==========

Duracell 9 Volt Battery
$2.75

==========

Please alow $ 8.00 for Pirority Mail Shipping, Tracking and Handling

Terms:

PayPal Now Accepted !!

Acceptable PrePayment in the form of a Postal Money Order, PayPal (If immediate shipping is desired) or a Personal / Business check is A-OK too if you do not mind a Short Shipping Delay due to bank processing time. This is required only the first time or two as once you are in the data base, PrePayment is no longer required

Bill,

As others have already stated, your idea will work.

Allow me to introduce another idea: why not feed the
inverted V in the center with ladder line? Good quality
ladder line is very inexpensive, (pennies per foot), and
extremely low loss.

Then, use a 4:1 balun at the house and a short length of
coax to bring the signal to the shack. This set-up has worked
very well for myself and others for years. Why not give it a try?

Gary WG7X

4213. Installing a good station ground system

Newsgroup: rec.radio.amateur.equipment

I have the following accessories for the DR-610T Dual Band Transceiver:

EMS-12 DTMF Microphone.....$45 shipped.
List price is $65.95

EJ-24U CTCSS Tone DECODE Module .....$55 shipped.
List price is $88.00

These are brand new, never used, in original packing.

If interested contact Don, W9SL, via direct email.

I have a used Vertex VHF VX-210 HT with a new FNB-V57 NiCd battery for sale.
Specs below - Sell for $175.00
Frequency Range:
VHF: 148-174 MHz

16 Channel Capacity

5 Watt Power Output (selectable to 1 Watt)

MIL-STD 810 C/D/E

12.5/25 kHz Bandwidth Programmable by Channel

PLL steps:
VHF: 2.5/6.25 kHz

CTCSS/DCS Encode + Decode
Positive Lock Channel Selector
ARTS (Auto Range Transpond System)
BCLO, BTLO, TOT
Tx/Rx Battery Saver Circuit
PC Programmable
Radio-to-Radio Cloning
Voice Inversion Encryption Available
Super Rugged Construction
DTMF 16 keypad (for VX-Trunk II Operation)
Intrinsically Safe Versions Available

hello,

i have a heathkit sa-2040 tuner for sale. clean and works. need to find the manual. this is a legal limit tuner that works great.

also, with this unit i have a mfj model mfj-815b swr/power meter. cross needle meter 200/2000 watt ranges. clean and works.

$200.00 for both. check around. good deal for a leagal limit tuner and meter. price PLUS SHIPPING to lower 48. postal money order for payment. sold as is but not D.O.A.

thanks.

its a micom crystal
i got them fired up and have got one on 80m now 180watts
it will be great in the van!!
what a tank they are though must weigh 40lbs
do you have any service info? like how the channel setup works
they seem to have been tuned for output in bands of two channels
like 1-2 for 2.5mhz
3-4 for 3-5mhz
and so on
with out at least a schem. i cant figure it all out
but the 5mhz seg seems to work well on 80m any way
found a crystal on a old modem in the garage that gave me 3.943 and it
really works well there the audio reports go like this YOU WILL BE
HEARD!!

hope you have something

4229. help needed with Yaesu FT-101ee

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-30 23:27:18 UTC
From: AB Brown <abbrown@nospammail.com>
Message-ID: <a85hj6olt1@slb6.atl.mindspring.net>
Source record: 45434
Cross-posted to: alt.ham-radio.mods,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I just burned out a final tube (6JS6C) in my Yaesu FT-101ee today. I wasn't sure of the cause and still am not, but when I placed the bandswitch in the 160 meter position, and with the heater activated, the radio lights went dim. By the time I switched bands, the one final tube was gone. This all happened without activating the PTT. I wanted to find out what happened, so I reinstalled the good and bad tube and duplicated the conditions: 160 meters, heater on, PTT not activated. Immediately, the lights dimmed once again and the IC soared to over 0.15 mA with the bad tube in place. None of the other bands cause this problem. With the tubes removed, the "short" doesn't occur on 160. What can be the problem? At first, I thought the tubes but why wouldn't the other bands cause the same results? I did recently rewire the transceiver to enable the CW position to be able to use the AM filter. Could a rewiring mistake cause the symptoms on 160? Note that I also get a strong CW sidetone when the bandswitch is in the 160 position and mode on CW. This is only when the tubes are in place. Heater on and PTT not activated.

Can anyone help me figure out what the heck is going on?

Thanks,
AB

You may also want to check with the ARRL as a resource, as there are
quite a few visually impaired ham operators. There is one in our club
who is quite active on HF, and very knowledgable about propagation.

Message-ID: <621d1b6e.0203301905.fd3abfa@posting.google.com>
Source record: 45441

I have a Sony ICF-2010 for barter.

It was purchased new in 9/97 from Grove Enterprises, and comes with original packaging, related materials and receipt. I keep it covered when it's not in use and even oil the antenna periodically. It's in perfect, unaltered factory condition, but I simply don't have the time to devote to the radio much any more.

I'd like to trade it for a decent 800MHz handheld scanner (preferably unblocked), transceivers of any type, or a base CB unit in similar condition. Mods are OK as long as long as it improved performance and was done professionally.

I paid $364 for the 2010, but I'm not expecting a dollar-for-dollar exchange here - just a fair swap for respectfully handled gear that I have a realistic use for. I'll consider anything you've got, except for junk and stolen property.

I think it's only fair that we each pay our own insured shipping. If you're interested, please contact me directly. I'm in no hurry and Thank You.

My good friend (N2IP) when living in an appartment several years ago, installed a good L-bracket on the bumper of his
car and with a Hustler quick dis-connect for the antenna. He used a modified Hustler antenna mast (longer) and various
loading coils depending on whichever band. He rolled out coax from the window of his appartment to his car in the
parking lot. Worked great for several years.

Mine did the same thing...the tubes went into self oscillation when
power was applied and they were executed in the proccess (well one was
anyway). Nothing was wrong with the radio...check the output PI
network for any damage caused and replace the finals..if you use
Sylvanias replace the 100pf cap in sreies with the neutralization
variable with a 10pf silver mica piece.

It appears you have a defective tube that just happened to go bad when you switched bands. Remove the bad tube and see if it's okay.

Thanks Art. I also noticed that, while unkeyed on 160 meter position, I get CW sidetone through the speaker, when switched to CW mode, with the good and bad tube still in place. The sidetone doesn't start until the tubes start warming up. Of course, none of these symptoms are present when I remove the tubes.

A strange, very isolated phenomenon to say the least! At first, I thought I rewired the switch incorrectly after installing the AM filter, but then the symptoms wouldn't occur once the tubes were removed.

I just received this radio by mail a few weeks ago and the tubes weren't removed during shipment. I wonder if this could have weakened them. Before I even modified the switch, I had to replace several components in the bias network because the current had soared.

Just looked over the manual, stared at it for a while, and not knowing exactly what you did to enable cw thru am filter, can suggest to check for obvious wiring mistakes. But further, with PA tubes pulled, can you get a wattmeter hooked to the "RF OUT" jack? This is the low level driver output for a transverter, etc. Should be on the rear next to the ground terminal. I suspect that for some reason you get the sidetone osc enabled with no key connection(which I recall trips the vox and keys the rig), and this is just blasting full drive to an untuned PA. Remember, the tuning is VERY broad on 160. You'll get drive no matter where the drive tuning is set, in my experience. It may not have done this on other bands simply because the setting of the driver tuning was not peaked for that spot on the band.

However, the only in 160 thing about sidetone really suggests a wiring mistake, that you'll need to trace.

Hope you find it. These are fine radios, I have three...

If something has to go, why not the wife? Top condition, used very
little, etc...

Take an ohm meter and narrow down which is PTT(push to talk)..then you'll automatically know which is audio.

You might want to explain to him what an ohm meter is. I believe this is a
CB'er. Oh and don't use the term PTT, use "key".

Just a question ... did you have the 3rd (TX) port of the
dupexer terminated in 50 Ohms while doing this?

If not, your tuning could be off and that could possibly
account, at least partially, for the response you're seeing ...

Date: 2002-03-31 13:32:29 UTC
From: "Bob M." <xxxxx@yyyy.zzz>
Message-ID: <NdEp8.493961$pN4.35165185@bin8.nnrp.aus1.giganews.com>
Source record: 45363

Any UHF duplexer experts out there?

I connected a spectrum analyzer input to the receive port of my duplexer (around 449 MHz). I connected the tracking generator output to the antenna port of the duplexer. I then looked at the resulting bandpass/reject response. Saw a nice 100+ dB notch at the transmitter's frequency and saw almost no loss at the receive frequency. Both of these are as I would have expected.

HOWEVER, when I expanded the bandwidth, I observed that there was almost no attenuation other than at the notch frequency. I would have expected the bandpass filters to have provided at least several dozen dB of attenuation at 400 or 500 MHz but all I saw were a bunch of 20 dB notches that looked like poorly filtered rectified AC on a regular oscilloscope. The duplexer tuning instructions mention peaking the bandpass filters, which was done on each filter using a signal generator and receiver only - I didn't have the spectrum analyzer at the time. This rippling effect extended all the way down to DC and up to 1 GHz (the range of the SA).

Am I missing something here, or am I expecting way too much? I did NOT check the transmit side, whose bandpass filters were tuned by maximizing the output power into a dummy load while transmitting. The duplexer seems to be working properly - it's an older Phelps Dodge 6-cavity unit, similar to the Celwave 526.

Any links to duplexer theory, tuning, and operation would be helpful as well.

Thanks. Bob M. WA1MIK

Does anyone have any idea what the life of an unused (as in brand new sealed) LiIon battery pack should be? The e-bay vendors say their packs are about 3 to 5 years old and are sealed as in original IBM sealed batteries.

Should I get one of these battery packs from e-bay (sealed never used from original IBM sources), or should I get mine rebuilt (at greater expense) with more recent manufactured LiIon cells?

Is this the same situation for NiMH battery packs?

Checking QST back issues has not been definite as far as information goes.

Hi:

Do you have a Motorola X9000 Series Mobile.

Need to get it Programmed? Its PC Programmable !

(With the hardware of course)

100.00ea+8.00 S & H

Photo @ http://www2.4dcomm.com/metrotech/mx91k_c.jpg

Terms:

PayPal Now Accepted !!

Acceptable PrePayment in the form of a Postal Money Order, PayPal (If immediate shipping is desired) or a Personal / Business check is A-OK too if you do not mind a Short Shipping Delay due to bank processing time. This is required only the first time or two as once you are in the data base, PrePayment is no longer required

Plse, SW is availible "Only" through Motorola C & E, so if you need SW, it is highly recommended that you contact them and get the proper SW and Support materials.....It's Cheap compared to a radio failure.

Source record: 45376

Surprise! This is what most duplexers are like. They focus on
the TX/RX ports isolation, but offer little more than 6-20 db of
help with the neighbors depending on the model. Some are
worse than others. Duplexers are just that: They allow maximum
isolation of the TX/RX ports to allow you to use one antenna.
If you need more help, add bandpass cavities to the TX/RX ports.

If you can afford it, put your Rx antenna at the top of the tower,
your Tx antenna 10' or more below and use bandpass cavities.
Don't forget the isolator on the transmitter.

On tuning your duplexer, it's not usually necessary to terminate
the unused port for the initial tune-up, but you can never realize
maximum isolation without doing so. Obtaining maximum
isolation and duplexer performance, requires experience that can't
easily be passed on in a tutorial.

On your model, you may need to adjust the notch in relation to
the (pseudo) bandpass peak. If you are using the Hi port for
RX, you have NO protection up to about 460 MHz. On the
low side you have little protection down to DC. But these
duplexers have Tx/Rx isolation better than 100 db (115-120 typ.)
with very low insertion loss.

Jim, ac6tk

4281. WinLink, PTC-IIe, and 706MKIIG

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-31 18:37:37 UTC
From: Dunc Fowler <Dunc.F@CenturyTel.Net>
Message-ID: <a87l3l$2riv$1@newsfeed.centurytel.net>
Source record: 45386
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,alt.ham-radio.packet

I am trying to set my 706 MK2G to interface with my SCS PTC IIe modem to use with WinLink to use the 706 in a split AFSK mode with Pactor II..
The setup instructions that are with WinLink are either not clear, or have been written for an earlier version of the 706.

I have installed the 500hz FL100 filter as well as the High Stability Crystal as has been recommended.

The radio settings instructions from WinLink say in part:
"To set up the split ("AFSK")mode, first select the radio's RTTY mode, then go to the radio's Quick Set Mode ... and set Q@ RTTY TONE to 2125, and Q♯ RTTY SHIFT to 200. Then get into Set mode ... " (and this is where I get lost), "be sure that "transceiver" mode (item 27) is set, and set baud rate (item 26) to 19200 baud rather than "auto"

My problem is that Item 27 in my set mode is "A-TUNE STRT" for starting the auto tuner, and Item 26 is "PWR ON CHK" for causing the power on check.

The only place where I have an "auto" choice is item 35, "CI-V BAUD I don't think this is what the directions were referring to.

I don't see any choices for putting "transceiver" as "set".

Any thoughts on this?

George,

Thanks for the tips. I'm relatively new to the Yaesu series, so any advice is helpful here.

After I installed the AM filter in place of the CW filter, I rewired the switch according to some instructions I received, which I believe are from the Fox-Tango group. However, I received 2 sets of instructions and both are different, unfortunately. The first time I rewired the switch, I had CW sidetone on all bands and both in receive and transmit. Going by the other instruction sheet, I eliminated the sidetone and everything seemed normal until I went to the 160 position and that's when my problems started. BTW, I will post a drawing of the switch rewiring arrangement if you wish.

I removed the 2 final tubes. I still get normal RF drive and modulation on all bands. However, everything on 160 is ok until I switch to CW. I then get sidetone on receive as soon as I switch the heater on. With the heater off, I don't get sidetone. I get transmit modulation on all mode settings, including CW! No sidetone present during modulation. Time to recheck the switch rewiring!

AB

4285. Re: Heil Pro Set - Opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-03-31 20:40:06 UTC
From: Rick and Theresa <n6cy@earthlink.net>
Message-ID: <GuKp8.5944$ml2.462570@newsread1.prod.itd.earthlink.net>
Source record: 45390

PTT is separate from the boom/mic headset. Usually implemented in a
footswitch, handswitch, or just plain VOX.

If you buy or make the adapter cord to go from the rig's front panel mic
connection to standard Heil headset connectors (1/8 inch mono mic plug and
1/4 inch stereo headset plug) you will have the jack for a 1/4 inch mono PTT
connection.

I recommend getting the regular talking element, and not the dx version
(which has higher response on the higher frequencies). Your rig probably has
enough equalization built in.

Check to see if you need to buy or build an inline mic pre-amplifier to
match ICOM's input audio level needs. Perhaps someone else with a 746.
Certainly older ICOMs needed it.

Opinion: Top notch boom/mic combination. Very comfortable to use over long
periods. Have used the micro Pro models for several years in contests.

Regards,
Rick N6CY

I had a similar problem. Had desense. Adding cavities didn't help.
Turned out that it was the third harmonic of the transmitter passing thru
the cavities and desensing the receiver. Lowpass filter fixed it. I was using
radios NOT designed for repeater operation. YMMV.

I thought about that, but there is a problem. To get the ladder line to the top of the tree would require me to run it the same way as the one antenna leg itself. If that were not so, I wouldn't even have thought of end feeding it in the first place.

Someone suggested feeding it with low loss coax. I suppose I could do that and bury the cable out to the base of the tree. I would have about 150 feet of coax with about 75 feet of it buried. Gosh, would the losses be high?

What band(s) do you plan to operate? Runs of several hundred feet are no problem
for coax at hf frequencies.

I like your attitude. The fewer places you look, the more
stuff I can get cheep!!
Everyone, it's risky out there, Do not buy anything from the
internet, turn off your computers immediately. :-)
mike

and your analogy sucks. A virus checker is automatically
removing the nails from the construction
site BEFORE you go there. And it's also active on the main
road....

Theres a quarter inch jack that you must put either a hand button switch or foot switch into....YOU MUST also get the heil ICOM preamp....or I think they have a dedicate Icom headset mic now...straight Heil 5 is no good without the preamp, and not that good with it...the dedicated mics are better...Hope that helps...73 Murray

Message-ID: <9gffau0mcnb4cbnht7mafo5nkhuitidof5@4ax.com>
Source record: 45309

I suspect the instructions were written for the previous models of the
706. I would set the CI-V baud rate to 19200 and the A-tune Start to
on. Does winlink or the modem connect to the 706 CI-V port ? IF so I
suspect Win Link is controlling the transceiver, so when it changes
frequency the tuner automatically tunes for the new frequency.

Hi.

If you follow-up to one of these newsgroups, could you please CC.
your reply to my E-mail address, if possible?

I recently purcased a used TS-940. Although the manual was included,
it was not very forthcoming about the details of the two "Accessory
terminals". "ACC1" is a 6-pin DIN connector and the manual has no
information whatsoever about this connector. "ACC2" is a 13-pin
DIN connector and, although the manual at least labels these pins,
it has no information on how to use its connections.

I am wondering if anyone can point me to any internet-accessible
interface protocol specification for these two connectors. I would
like to obtain enough information to home-brew a hardware interface
to the shack PC, and to write my own software for things like
controlling the TS-940 from the PC, automatic log entry of time,
frequency, etc., if this information is availablve through the
interface. In addition to any available protocol specification,
any articles, application notes, etc. would also be useful.

Thanks and regards.

To carry on, your virus checker picks up all of the magnetic nails,
but might miss the new non-magnetic aluminum nails.

Common practice is to never open an attachment which could carry
macros, except from a thoroughly trusted source.

Happy trails,

Another very good posibility since you mentioned the bias reworking is
that the radio was at one time used on CB and is "cooked"...a lot of
these radios saw cb service at the 100 watt level and payed the price
for it. Check out an EXCELLENT ft-101 site at:

www.qsl.net/nw2m/ft101.html

Best site on the web of info.

4313. Re: UHF Duplexer Tuning Experts?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-01 04:21:57 UTC
From: Joe Leikhim <jleikhim@nettally.com>
Message-ID: <3CA7E064.81C335C9@nettally.com>
Source record: 45317

I ran into a problem where a commercial repeater's receiver had very poor spurious/image rejection. It had apparently not been strictly tested to EIA-603 or it wouldn't have passed. The receiver had a spurious response (an IM product involving the LO) way out of band on the low side. The transmitter/PA produced a lot of noise that fell exactly where the spurious receiver response existed. The pseudo-pass/notch duplexer was ineffective at attenuating the noise. A really difficult problem to diagnose.

For sale,
Brand new 48 volt DC 3.2 amp (150 Watt) swiching power supply. This is a small lightweight, shielded unit about 7.2 x 1.5 x 3.8 inches. Was used briefly for an experiment. Can be easily switched from 115 vac to 230 vac. Has voltage sense leads and voltage trimmer.

Good for a MOSFET amplifier project.

$40 shipped in US.

> it in the first place.

The ladder line could couple with the antenna if the line were off the
ground, and fairly parallel with the antenna leg. But it would still
probably work ok being as you would be likely using a tuner. But there
is an even worse potential problem. If you had the ladder line in the
air from the antenna to the shack, that is VERY dangerous as far as
potential lightning strikes.
>
> Someone suggested feeding it with low loss coax. I suppose I could do that
> and bury the cable out to the base of the tree. I would have about 150 feet
> of coax with about 75 feet of it buried. Gosh, would the losses be high?

No, not overly so. I would prefer the low loss coax, but keeping in
mind, it won't be an "all band" antenna. But if you used a tuner,
there are other bands you could work with fairly low losses even with
coax. If the feed impedance for a certain band is low, or fairly low,
you will do ok. But if the antenna is a full wave, IE: using a 40m
dipole on 20m, the impedance is quite high, and the feedline losses
will be high. But the same antenna on 15m will work quite well. It's
an appx 3/4 wave per leg, and a low impedance feed. For the band the
dipole is designed for, the losses of 150 ft of decent coax are not
enough to worry about. But as a bonus it's much easier to install
lightning protection using coax. Just the act of dropping the coax
down the tree to ground is 75% of the battle. Dipoles don't really get
struck all too often, but it's comforting to know that if you do take
a strike, the bulk of the energy will go to ground at the tree instead
of going to your house as in the case of a feedline that is suspended
in the air to the shack. Unfortunately, you can't really lay ladder
line on the ground. The ladder line would be handy if you didn't have
that to worry about. It lets you use all bands with fairly low loss,
but in my case I would use no coax feeder to the shack. I'd run the
ladder the whole way to the tuner. I'm not a fan of using a balun to
go to coax from ladder line. For one thing, the chances of the balun
being the wrong transformation ratio are about 80% depending on the

band used. I'd just as soon run the ladder line the whole way if I were to use it. MK

4316. FS: Kenwood TMV7-A and Comet GP-9 antenna

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-01 06:44:30 UTC
From: bearcat51@yahoo.com
Message-ID: <9014cad1.0203312244.1f4ae723@posting.google.com>
Source record: 45320

Hello, I have the following for sale:

1) Kenwood TMV7-A mobile dualband radio in mint condition, used only a couple of times. All accessories included. Here are some specs for the radio from Kenwood's web site:
-Large, reversible LCD display (the display is also removable for the security conscious)
-Dual receive on same band (f2), in simultaneous receive on VHF and UHF bands
-Up to 280 multi-function memory channels (180 channels when using Memory Name function)
-Memory name function. Identify each channel with up to 7 alphanumeric characters
-"Five-in-one" programmable memory (store five entire operating profiles)
-Guide Function
-CQ Review - check it out!
-PC programming software available for download (requires PG-4S cable)
-144 MHz/440 MHz
-Optional VS-3 voice synthesizer
-Optional remote head kits
Power is 5 (low), 10 (medium), and 35 on UHF (high) or 50 on VHF (high).
If you want more info on the radio, here is a link to Kenwood's web site:
http://www.kenwood.net/products/index.cfm?AMA=open&ama_mob=open&radio=TM-V7A&selection=Amateur&ID=25
Kenwood has a suggested retail price of $449.95 but I am asking $350, which includes S/H via UPS anywhere in the continental US.

2) Coment GP-9 dualband base station antenna. This antenna has NEVER been used. Here are some specs from Comet's web site:
-It has a max power input of 200W, 8.5 db gain (146 MHz), 11.9 db gain (446 MHz), and a VSWR of 1.5:1 or less.
-It has an SO-239 or Female N-type connector.
-The antenna comes in 3 heavy duty fiberglass sections and is about 18' long total.
Here is a link to Comet's web site for more info:
http://www.cometantenna.com/base.html
Asking $150 for the antenna, which includes S/H in the continental US.

If interested in any of the two items or if you have questions, please email me at bearcat51@yahoo.com. Thanks!

I found dozens of great Ham Radio Equipment Photos at...

http://www.ab7sl.com

This is a site I can recommend..check this out...

1. Electronic QSL Card service
2. AB7SL Online DX Logbook
3. DXCC 'Need List' - only 19 more for Honor Roll!
4. The DX Page w/ Live DX Cluster Telnet links (USA & other)
5. Official W9INN Antennas Page
6. Up-to-Date IOTA List - downloadable (text or MS Word doc)
7. Complete AB7SL station description
8. Equipment Photos page
9. Complete Arizona Repeaters Page
10. Cushcraft R7 / R7000 Page w/downloads, photos, schematics...etc
11. Ham Radio Q Signals Page (very complete)
12. Software Downloads Page
13. AB7SL Bio Page
14. W7NH (sk) "My Elner" Tribute Page
15. The Weather Page
16. Prescott, Arizona Page - tons of photos!
17. Personal Photos Page
18. Grand Kids Photos!
19. Frequently Asked Questions Page
20. 3D Art Galleries (3) Original desktop wallpaper
21. Music Modules Page - free player and free music
22. Resonator Blues Guitar Page - silver plated guitar!
23. Ham Radio Web Rings Page - tour other Ham radio sites

All at http://www.ab7sl.com

4318. Repairs - Sommerkamp?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-01 09:21:57 UTC
From: Chris Wood <g0kmx@blueyonder.co.uk>
Message-ID: <VEVp8.23470$2O2.1076676@news-binary.blueyonder.co.uk>
Source record: 45322

Hi there and thanks for reading this.

I am desperately looking for company who would be willing to take on the repair and refurbishment if necessary of the following radio:

Sommerkamp TS788DX

10m Multimode mobile rig (100w)

If you know of somebody who is suitable qualified and has access to the appropriate test equipment I would like to hear from you. I have tried Castle Electronics who have stated that it would not be worth their while.

Thanks a lot

Chris (G0KMX)

Email: g0kmx@blueyonder.co.uk

The TS 940 and the 950 are pretty similar. I think the manuals can be
downloaded, or e-mail me.
In article <a88j60$8u0$1@freenet9.carleton.ca>, Ed Pugh

considering the radio is only worth about 100.00 in tip-top shape, the cost to send it to the us for repairs would be out of the question the shipping would kill you.
my suggestion use it for a door stop or give it away to someone with a working unit for parts and just buy yourself a new radio.

Naw, my ex was always bitching about too many toys. That's why she's an
"ex". It's a question of supply and demand. When one has more access to
women than toys then one values toys over bad women (shrews). Besides,
there are too many good'uns out there to put up with a shrew. Example:
my current YL of 20 years is an "Extra" herself and more "into" radios,
motorcycles, et al, than I am.
>
> I've never had a radio that was able to give me good sex!
>

The you've never sent a mating call via CB near a big truck stop.
Besides, shrews who get off telling their husbands what they can/cannot
own/do are too selfish to know what good sex is let alone how to provide
it. They're too self centered and life's too short to waste on them.

Hi Murray, I used to do mobile installs for a Motorola shop, several years ago. We did a few installs for the I.R.S. agents and such. There was an antenna that they used to supply us with to have installed, just like what your asking for, since these car were "under cover" vehicles. I know they exist or at least did at one time but unfortunately I cant tell you who makes them - its been to long for me to remember. I do know they worked very poorly though - on all the bands it was used for, and it was very expensive.. I think the tri-plexer idea is far better and a whole lot cheaper. (but less "disguised" of coarse), its basically the same thing as the disguised antenna anyway. They have a "Matching" box/triplexer as well. The other advantage to doing the tri-plexer with a ham type antenna is, it would work very well on 2/70cm and probably well enough on am/fm broadcast. Let me know how succesfull that is, I would be interested to know how it works out.

Hi Rick,
My T8 has failed in two ways. The battery clip
broke. So now I hold the battery to the radio
with a large rubber band. Then the exact think
that your radio has. Now I just use it as a
scanner. Oh it doesn't work long between charges
either.

4327. Yaesu FT-101ee conversion to 6146 experiences??

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-01 18:11:16 UTC
From: AB Brown <abbrown@nospammail.com>
Message-ID: <a8a7qi$l5c$1@nntp9.atl.mindspring.net>
Source record: 45331
Cross-posted to: alt.ham-radio.mods,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

As most who read my posts are already aware, I have blown 6JS6C tubes in my FT-101ee. For replacement, I was going to try to obtain a matched replacement set until I found out the price. A well known firm just quoted GE and NEC prices for a matched pair of 6JS6C at $135 and $160, respectively. I recently purchased this FT-101 for $150, so it doesn't make much sense to spend more than I paid on a new set of tubes. So, I'm wondering about personal experiences converting to 6146B tubes, based on a fairly recent past QST article. Any successes, failures, or any other tips would be much appreciated.

Thanks,
AB

Source record: 45333

I had a license in Australia many years ago (VK4FE), but sold most of my gear (primarily Yaesu FT101/FR101) when I went to work in Taiwan, where I was not allowed to operate or even own amateur radio gear.

I am now living in the US and wouldn't mind getting back into amateur radio. I've started looking at the sample exams and think I should be able to pass at least General. Need to brush up on the code.

Equipment has changed a lot in 15 years. What's a good HF rig these days? Not too expensive -- less than $1000.

I don't have a suggestion, but I have a comment. I remember when you could
get horizontal sweep tubes like 6LQ6, 6KD6, etc for about five bucks apiece,
and it wasn't all that long ago. Though the quality may not be equivalent
to domestic tubes, there are new [mostly audio] tubes coming out of China
and Russia for reasonable prices, and it really irritates the living heck
out of me to see these money-lusting opportunists driving the prices up on
American NOS just because there are idiots who will pay it while the rest of
us have to suffer without..

I don't know that you're gonna find 6146's any cheaper, cuz just about
twenty years ago you could rob them out an old commercial mobile rig or get
them from almost any local ham who had them laying around in the ham shack,
but from what I understand these are now difficult to find as well. Guys
used to give their old equipment away to people who needed it, but all of
sudden anything which is labeled as "vintage" or "obsolete" is made out of
gold, and people literally *hoard* it for the "collectibility" and make it
unaffordable to those of us who need it for practical or recreational use..

Fortunately, I have a selection of NOS audio and RF tubes to use as
replacements for my own equipment, cuz even though I can afford new tubes
i'd probably let my equipment sit on the shelf and gather dust before
catering to the "collectors" and greedy consumer slavemasters..

4333. Re: UHF Duplexer Tuning Experts?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-01 20:27:22 UTC
From: Tom Brown <tab@signalgrp.com>
Message-ID: <3CA8C2AA.EAA3982B@signalgrp.com>
Source record: 45266

1- High pass port should be tuned to the higher of your two frequencies
2- Low pass port should be tuned to the lower of your two frequencies
This *does* make a difference.

The oft missed issue in retuning duplexers is return loss. Most UHF
duplexers can be retuned as far as the notches are concerned, only to
find
that the return loss is poor (i.e. poor VSWR). Each port has two
characteristics: notch depth/width with respect to the opposite
frequency
and return loss at the "pass" frequency. Generally, this is a function
of the coupling line length and the tap on the helical (assuming a
small,
helical resonator type duplexer).

Additionally, ports should be terminated with a 50 Ohm resistive
device - a non-active TX is probably not 50 Ohms.

I turned on my radio this morning, April 1, 2002, and the S-meter light came on, and the light behind the analog frequency dial came on. But no digital display and no audio at all comes from the speaker. I turned on the 'heater' switch and let it warm up, but no signs of transmit. Am I looking at a power supply problem? Any suggestions on what to check?

> wondering about personal experiences converting to 6146B tubes

I had the pleasure of dealing with one of them attempts with an old cheap
guy next door who tried to do it to save $16 on tubes on the 70's.
Converting is a nightmare, if you dont know how to do it stay away.
First you have the a serious re-socketing/mounting issue/rewiring.
Then after that you find the ALC, neutralization, bias must be reworked.
In the end you will likely with end up with an RFI spewing oscillator ...its
not worth it
$150 is cheap for a 101EE pay the $135 or find some good pulls

>I recently purchased this FT-101 for $150, so it doesn't make
> much sense to spend more than I paid on a new set of tubes.
Hey.....Thats cheap for a 101EE id pay the $2

Hello

I have a very nice FT-840 HF Radio. 10 thru 160 meters. Radio is about 6 months old and is in as new condition. Full power and everything works great. Comes with book, mic, cables and box. Selling so I may pay medical bills. $500.00 plus shipping. Any questions please email me at kb0mai@msn.com

Any suggestions on what to check?Mine has been doing that for about 2
years.
After 5 minutes I whack it on the top and it comes back to life. Im asuming
it has some dirty switches.
I just havent had time to get into it yet. I also dont have any antennas up
so Im not
too motivated. Paul N9emx.

Thanks for that pointer, Mark.

Oh, and I was forgetting that I had a Drake TR7 after the Yaesu twins.

Thanks for the response.

Yes, the transmitter was connected but the PTT line was disabled for safety
purposes.

Thanks. Been there, read it. Somewhat helpful as far as actual tuning procedure goes. I was more interested in why the bandpass didn't drop significantly the farther I went away from the passband frequency.

Lots of very small "molex type" connectors in there. Make sure they are all clean, and making connection. Lots of older rigs do this.

At just under $890.00 US, The IC-706MkIIG is an excellent deal for a radio. I use one as a base rig, and it's been very good to me. 160-6M , 2M, and 70cm, DSP, band scope, the works. Great rig for the money, and it's got everything you'd need for a base rig to get started.

Hope this helps.

Thanks, Jim.
As it is, the duplexer was originally in the 461/466MHz band and the high port / low port decision had been made at the factory. When I got the unit, someone before me had tuned it into the 444/449MHz range and used the TX port for the transmitter and the RX port for the receiver. I think in commercial service they transmit high, receive low, but on my frequency, it's just the opposite, so the hi/lo ports may be doing the wrong duty. I did ask people at RFSystems and they told me the duplexer is basically two three-cavity units and it doesn't matter which one is used for "hi" and which is used for "lo". After hearing that, I didn't worry about it any more.

By the way, I am getting about 110-115 dB of transmitter frequency attenuation from the antenna port to the current receive port, so the thing is definitely duplexing.

I'm using a Super StationMaster antenna that's up 400 feet on a 600 foot tower. It's being fed with 550 feet of 7/8 coax. Two antennas and two feedlines was NOT an option that I even considered nor wanted to fund, however better it will be.

I was just hoping to see a much better bandpass response with attenuation increasing as I moved away from the pass band frequency, and not seeing it was cause for worry.

When we last tuned the duplexer, both radios were attached to their respective ports and a 50 ohm dummy load was on the output. The bandpass responses were adjusted for maximum power (we didn't have the SA and tracking oscillator at the time). The notches were adjusted by replacing the dummy load with the signal generator and using another receiver with a signal strength meter on the port in question. The third port still had its respective radio attached, but since we tuned the notch of each cavity separately, this really isn't necessary. The only thing done "en masse" was the bandpass of the tx and rx cavities. Naturally, with an SA and TO we could have done a lot more analysis and even flipped the two sides to see if that made an improvement.

Thanks.

At the top of the 600 foot tower is a 4-bay FM antenna being fed by a 10kw transmitter through 3-1/8 inch coax. My antenna is side mounted at 400 feet. The building is all metal and we really don't see any leakage of anything inside. There are no other commercial, amateur, or cell transmitters on the tower (yet) so I think I can rule out desense. There is another tower 3/5 mile south that has another FM, two VHF TVs, a UHF TV and a DTV transmitter. I suppose they could all be mixing somehow...

I think a preselector on the receiver would be a good thing to have but doesn't seem to be necessary yet.

Thanks. I'll keep that in mind since a 20kw FM transmitter running at 10kw is sitting about 10 feet away from me. But the building seems real tight (it's all metal - cellphones don't even work from inside) and I haven't seen any spurious signals near the repeater input yet. The tests I ran were with a spectrum analyzer on the receive port and a tracking oscillator on the antenna port of the duplexer. Nothing else could get in, so we were really seeing just the response of the duplexer.

Most likely the low voltage regulator in the PS. Not a real common failure,
but for sure one that'll give you the symptoms stated. Get your meter out,
measure for 12 volts at the supply output, if it's there, look at the 5 volt reg

for the VFO and digital display. The trouble's not far away. Also, check
the jumper plug in the back of the rig, see if it's in all the way or missing.

You may want to contact Amateur Electronic Supply, and ask for their paper catalog. It's free, it's big, over 150 pages and has all the popular ham gear in it. Go to http://www.aesham.com to order it.

You might also want to subscribe to QST. Then, you will be able to access the member's-only part of the ARRL web site, where you can see their product reviews for any rig made, going back to the early 1980s. Go to http://www.arrl.org

Current popular rigs -- for 160 meters through 70cm, the Icom 706MkIIg and Yaesu FT-100D, in the $850/900 price range. For 160 through 10, the Icom 718 and Yaesu 840, in the $600 price range. The Kenwood TS-50S, 160-10, about $700. The Ten Tec Jupiter, 160-10, about $1180 factory direct. Or the Ten Tec Pegasus, about $800 for a 160-10 rig that works with your computer & moniter as an interface.

Try the web sites for Icom, Ten Tec, Kenwood and Yeasu. All of their rigs are there.

Have fun, and welcome back...

Well, I never got married 'cuz all I ever did have was experience with
the shrews - it seemed _all_ the women other guys were married to were
like that, and I didn't want to get involved. So, I stayed single.
Am putting together the ham station I always wanted right now, not
having to ask anyone. Am 25 years into a road rally hobby, and have
never had to ask anyone if I could go to a road rally, either. Just
went. Like it this way.

Source record: 45263

If you are ready for a high performance multi-band HF mobile antenna, then I ask that you
visit www.qsl.net/k4kwh. This is a very heavy duty screwdriver-type antenna and goes beyond the cheap materials often seen in some others. Here are the basic specs.

Carolina Cyclone I

Full 2" loading coil (compare to 1 1/2" on DK3 copies)
#14 silver plated copper windings (compare to skinny little #16 wire on DK3 derivatives)
Wound at 8 turns per inch (compare to 10 TPI on DK 3)
Extra heavy duty finger stock using 1/4" wide fingers and extra springy for complete contact
(compare to the little copper or brass stuff that breaks easily)

Handles up to 800 watts SSB (Try that with a PVC screwdriver coil!)
impedance matching done with a simple little inductor at the feedpoint. No toroids to
give "finicky" performance/matching up on the higher bands.

And all without breaking the bank like those $300+ versions! Just $240 shipped to the
lower 48 states!

Hey, guys, it's SPRING (at least in the South), and it's time to get out and get that mobile
up and running!

Thanks Paul. That clears up a lot of things if that is the case.
However, the frequency on the label of the filter says 9.0109 Mhz
which is the same frequency of the FL100 or FL101 CW filter. Our local
ham dealer's catalog shows the FL232 as a 350 Hz CW/RTTY filter for
the IC706. Now I am getting confused. A friend has an IC706 MKII that
he will try the filter in for me.

My oldest AES catalog is for Winter/98. Under accessories for the 706 Mk II it shows the FL232 as a 350 hz 9 mhz IF cw/rtty filter, so it should work for that rig. Don't know about the earlier 706, but I can't imagine why it would not work for that, too.

They do list an FL-223 1.9 khz 9 mhz IF filter for narrow SSB on the 706 Mk II. Maybe that's what Paul has your filter confused with.

You did noy say used or new. There are tremedous deals on used hf
gear these days. AES and Hamstation have good prices on used gear that is
GUARANTEED for I believe 30 days. Best deal out there in your price range is
the Kenwood TS850SAT - a fabulous rig that goes for usually well under
$1000. If you want allmode 6 meters and 2 meters also then look at the Icom
IC746 for usually just about $1000 used. Good luck! --- Steve KK9ZZ

You have to be careful of the numbers. The FL-232 is the 350 hz CW-RTTY
filter, the FL-223 is the 1.9 narrow ssb filter. I have both of them
installed in the 706G .

4368. Re: UHF Duplexer Tuning Experts?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-02 03:19:39 UTC
From: "Bob M." <xxxxx@yyyy.zzz>
Message-ID: <fr9q8.197491$2q2.17089780@bin4.nnrp.aus1.giganews.com>
Source record: 45273

Thanks. I figured if it didn't make a difference, why label them as hi and low? Actually the original labels just say TX and RX, but the model/freq label does show the actual frequencies in use, so I could relabel them HI and LO. However, it would also require an hour or more of time retuning it, and this time it would need to be done at the site. It was easy before the repeater went active to do it at my house. Some day, if/when I have nothing else to do, and have the proper SA with TO at my disposal, I'll think about retuning it, but that would also mean physically reversing the tx and rx ports, which would not be easy to implement, given the current repeater construction.

Since we tuned each cavity independently, the matter of terminating the other port doesn't apply here. Granted, if we were tuning it with everything connected together, it could make a difference. We found that the attenuation was just too great to do it that way, so by measuring 35 - 40 dB per section, we were well within the accuracy range of the equipment being used.

I have not measured the transmitter power going into the duplexer, but it's a 40 watt Maxtrac radio which puts out anywhere between 40 and 45 watts into a dummy load. I'm sure I'll be surprised when I put the wattmeter between the transmitter and the duplexer, but assuming that power input, I'm measuring 33.5 watts coming out of the duplexer with absolutely zero reflected power, so the transmit side loss is fairly low, probably in the 1-1.5 dB range, which is right around the spec for this unit.

Another thing I had to do was replace the inter-cavity cables. The original ones had gotten very stiff, and the connectors started twisting on the cables. This caused little pieces of braid to break off inside the connectors and some shorted out the center conductor. That didn't help the tuning effort much. For a while, I was putting out 40 watts from the transmitter but getting 0 watts out of the duplexer. The transmitter never seemed to complain - it kept drawing the same 8-9 amps of current but I have no idea how much power it was actually trying to push out. A $225 cable set cleared all those problems up, and they now crimp the N connectors on instead of relying on the mechanical two-piece with rubber gasket screw-together-and-solder connectors.

Yes, Ron. That's the article I was referring to. It can be found on the ARRL website and accessed if you are a member. What I'm looking for here is the results that people have had when following the article's instructions. I really don't want to take on this task without some input from others who have actually performed the mod.

An old car battery and a 6 amp supply is what I use for mine... Cost me all of $60 more... Another $3 for the cookie sheet to put the battery on (in case it leaks), and you're still well under $1000

The 746, 756, and most other rigs need a power supply as well, as most rigs that I've run across run on 13.8 volts.

Hello I got more stuff 4 Sale.....

Swan 250C "EXCELLENT" Condition 6 Meter All Mode Transceiver. The Optional Accessories are:
Swan Matching 117-XC Speaker/Power Supply, "RARE" Swan 210 External VFO, Swan NS-1 Noise Silencer, Swan Desk Microphone, Swan VX-2 Vox Unit, Swan SWR-3 SWR Meter.......$600.00

Drake TR-6 " EXCELLENT" Condition 6 Meter All Mode Transceiver. It is very nice, and the Optional Accesories are:
Drake MS-4 External Speaker, Drake AC-4 Power Supply, Drake 9-NB Noise Blanker, FOUR Filter included.... TWO SSB Filter, ONE AM Filter, ONE CW Filter, & Manual..............$1300.00

LARGE HAMMARLUND EXTERNAL SPEAKER, NICE CONDITION.....$99.00

HALLICRAFTERS R-48A EXTERNAL SPEAKER $89.00

SMALL HAMMARLUND EXTERNAL SPEAKER.....$75.00

VERY NICE HAMMARLUND " ORANGE EMBLEM" EXTERNAL SPEAKER $99.00

HALLICRAFTERS R-46B EXTERNAL SPEAKER.....$89.00

HYGAIN 3806 VHF FM TRANSCEIVER UNTESTED WITH MANUAL..... $20.00

TOKYO HY-POWER HL-30V 30 WATT 2 METER AMPLIFIER.....$30.00

COLLINS SM-1 DESK MICROPHONE, NEEDS A NEW MIC CABLE, IN GOOD CONDITION $200.00

COLLINS KWM-1 189A-1 PHONE PATCH.....$50.00

Collins PM-2 power supply $195.00

DX Engineering Voice Processor for a Collins 32 Transmitters....$275.00

Collins 270G-2 External Speaker.....$285.00

Yaesu FV-401 External VFO nice condition with connecting cable, and manual $59.00

Yaesu SP-401P with manual nice condition $35.00

Yaesu Landliner LL-301 phone patch......$29.00

AEA PK-88 TNC with manual $35.00

Gonset GSB-201 desk amplifier runs 4 - 811's with manual wired for 110 volts, puts out 500 watts $240.00

Multi/Elmac PMR-8 untested $26.00

Eico 625 Tube Tester with tube chart.....$50.00

Heath-Kit "THE TWOER" in EXCELLENT a COLLECTOR item for sure with the
AC/DC cable, and original heath-kit microphone $99.00

Heath-Kit HW-22 SSB Transceiver with original Heath-Kit microphone,
mounting bracket and matching Heath-Kit HP-23 power supply.....$125.00

Heath-Kit AM-2 wattmeter.....$20.00

Micro-Match (vintage) # 262 RF Power/VSWR meter...$75.00

Autek Research Message Memory CMOS Keyer MK-1.....$75.00

Palomar Tuner/Tuner PT-340.....$55.00

B & W # 595 6 position antenna switch.....$30.00

KNIGHT C-577 COMPRESSOR.....$15.00

Courier Port-A-Lab 500 wattmeter/VSWR/Modulation/Relative Field Strength
Meter.....$39.00

Maxon (TWO) CS-0510 4 channel handhelds with swivel cases
(can't test do not have a charger) Both for $55.00

Yosan HJ-502 "NEW IN THE BOX, NEVER USED"
WITH INSTRUCTIONS, AND ORIGINAL BOX
Power/VSWR/Modulation/ AND a frequency counter.....$85.00

Icom BC-35 quick charger for the BP-7, BP-8...$40.00

ICE NC-580 BATTERY CHARGER FOR ICOM BP-7, & BP-8.....$27.00

Kenwood SMC-25 speaker/microphone for the TR-2500, TR-2600...$20.00

Kenwood YK-88CN 270HZ C.W. filter on 8830.7 KHZ.

This filter will fits these models:
Kenwood TS-130S,130SE,430S,440S,530S,530SP,830S,670S,660,and
the R-5000. .....$60.00 shipped in the U.S.

Kenwood YK-88C 500HZ CW filter on 8830.7 KHZ.
This filter will fits the following models:
TS-120S,130S,130SE,430S,440S,530S,530SP,670S,180S,830S,660,
& R-5000..... $60.00 shipped in the US.

Kenwood TU-4C (new in the box) is the Tone Encoder for the Kenwood
TW-4000A 144/440 MHZ dual band mobile radio $45.00
shipped in the U.S.

KENWOOD CK-18 WARC BAND COIL PARTS KIT FOR THE TS-180S (New In
The Box),(UNUSED) This will add 12, 17, 30 meters to your Kenwood
TS-180S, instruction manual included.....$65.00 shipped in the
U.S. ONLY

Kenwood IC-10 (set of two chips) these are required for computer
control when using a Kenwood TS-440S, and R-5000
.....$49.00 shipped in the U.S.

Part of the reason that tube prices went up is due to fewer being made and
sold.
I saw this while working in my brothers TV repair shop.
6146's are much lower priced compared to those 6js6c's, at least on the web
site I had located by doing a search..
And, IMO, are a bit more durable.
Though I never used them to replace the 6js6c's...
Need to change the socket for that.

So far as I remember the sub tone generator is already built into the
IC-271. It was the sub tone decoder that required the add on board UT-15.
The UT-15 used a Comm Spec board for the encoder and decoder, if you were
to find the UT-15S, it has the Comm-Spec board with it.
I do not remember how to enable the built in tone encoder though.

Yes, I know. I wish there was something that could be done but I guess it is the rarity of the tube that drives the price way up. I notice that almost all sweep tubes these days are high priced. Also, I guess they're not really meant for RF amplifier service and better suited for 70's televisions, which would also be a contributing factor. One often wonders why reputible manufacturers would have used them anyway as RF amp tubes. Cheaper at the time I suppose.

Just a few years ago, I probably had a dozen 6JS6's. Not thinking I would ever be going back to tube equipment, I practically gave away close to 500 tubes. Now, obviously, I'm seriously regretting my mistake!

I've always liked to troubleshoot and repair my own equipment. With tube equipment, I am quite the novice but I know this will improve over time. Earlier solid state rigs were challenging to repair, but I almost always managed to get them up and running again, at least 80 percent of the time. Today's modern rigs are beyond my capabilities to repair, especially with all the surface mount components involved. Therefore, I tend to avoid them but the door is then opened to earlier rigs. However, obtaining parts gets more and more difficult as the equipment ages. This Yaesu tube situation is a good example. It's unfortunate for those like me who like to keep older equipment functional.

BTW, I'd like to thank those people who provided several alternatives to obtaining the 6JS6C's at more reasonable prices. I intend to look into these further.

If I decide to convert to the 6146's, I'll post the results since there seems to be little feedback info. regarding this subject.

Thanks again and please continue to share opinions and experiences with the 6146 conversion.

Despite what "they" may say, rechargeable batteries do not have an infinite life. Eventually they get tired and refuse to charge as much. Buy a new one from Maha or another of the many after-market battery vendors. Then you'll have a battery clip that works too.

I haven't had the experience of having my T8A transmit go dead, but others have suggested it could be the wire from the PA to the antenna. It's simple to check, so by all means check it.

Bob, KI8AB

4390. FS: Yeasu FT 101ZD/FT 901DM/ FTV 901R Transverter

Newsgroup: rec.radio.amateur.equipment

I have for sale the FT 101ZD, FT901dm/ and a FTV 901R Transverter. They are all in great condition. The transverter covers 6mtr, 2mtr, and 70cm allmodes at 10-20 watts. The FT101zd covers warc bands 160-10 meters Power output is 100 watts. The FT901DM covers 160-10 no warc, has low output, about 50 watts, everything else works great. All are very clean. The 901 is missing the little cover on the top of the radio. They are both run off 110 volts. Ready to plug in and rock and roll. This is a hot little package, Comes with a D104 desk mic. If interested Please email me at cherrymt@ncia.net or kb1ffx@prodigy.net I would like to get $750 Plus help on the shipping as this is a heavy package, for the package Or trade for newer hf rig, solid state.in this price range. Let me know what you have.

Unless you're buying a high-end rig, the power supply probably won't be built in. A supply for a 100 watt rig, one that has about 20-25 amps output, runs about $110 to $175, depending on brand name, meters and accessory outlets. The cheaper switching supplies are a good way to go, to save money.

Otherwise, many folks use batteries and re-chargers, and never have to worry about the local power plant going down :-)

There are a few web pages out there, somewhere, about the use of batteries to power ham rigs -- you could do a search.

I don't run a battery charger... I run a filtered, regulated power supply
to keep the battery topped off. Stays on all the time, unless the power is
out, and then I have almost 2 days worth of battery power before it's dead
altogether, if I transmit, that is...

The 706 was HF, 6 and 2M only, 100 watts on HF and 6 and 10 watts on 2M
The MkII took all of that and improved the board. Not sure if there was a
difference in the power output levels, but DSP was an option in the MkII
The MkIIG is HF, 6, 2, and 440. 100 watts on HF and 6, 50 watts on 2, and
25 watts on 440, built in DSP, and all the bells and whistles.

I realise this, but such has not always been the case. People in general weren't so greedy and money hungry until just a few decades ago, and were more willing to give things away to those in need. It's not so much that people nowadays want money for their goods, but rather the outrageous profit margins that perpetually rise because of "lack of availability" and the lust for money on the part of those who hold us in virtual consumer slavery..

Example: I *used* to collect coins as a *hobby*. Why is it that when a new commemorative coin such as the Susan B. Anthony or Eisenhower dollar, the Kennedy half dollar or the new state quarters are issued, the yuppie idiots immediately run down to the banks and buy hundreds or thousands of them to stick up in a closet and sit for decades, and save *every* single one that they get in change, thus limiting the legitimate collectors of the pleasure of finding and/or affording them for their hobbies? The same can be held true for vintage ham radio equipment, parts and accessories..

I'm from the old school when people put more value on kindness, reason and human compassion than riches, and i'm not at all impressed by what I see nowadays. There are entirely too many selfish people in the world today..

It's called free market capitalism, where the demand regulates supply. If there are a few items many people want, prices will go up. It's a beautiful concept when you think about it. So simple and natural.

> Example: I *used* to collect coins as a *hobby*. Why is it that when a new
> commemorative coin such as the Susan B. Anthony or Eisenhower dollar, the

> of finding and/or affording them for their hobbies?

Because they know that years later collector idiots will pay good money for shiny quarters no one bothered to save when they were widely available?

> The same can be held
> true for vintage ham radio equipment, parts and accessories..

The solution is simple: we have to establish a Central Committee which will nationalize all the vintage ham radio equipment and which will then redistribute it according to the needs of the people.

> I'm from the old school when people put more value on kindness, reason and
> human compassion than riches, and i'm not at all impressed by what I see

Bullshit. This is nothing but geezers' cry about the good old times. It's never as it used to be - it was always better when we were young, wasn't it? Even when there was slavery, tyranny, plague, no elections, no electricity, no food, no fire...

4407. TS-820 Question

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-03 00:18:00 UTC
From: gil <gilpi@mindspring.com>
Message-ID: <a8dhmfogj1@slb6.atl.mindspring.net>
Source record: 45212

I have an oportunity to get a good TS-820 as a first rig, How does this rig stand up to newer entry level rigs?
Any opinions and comments appreciated

Tnx,

Gil

4408. For Sale: Ameritron AL-1500 HF Linear Amplifier

Ameritron AL-1500 For Sale. Purchased 04/1995.
Kept in Non-Smoker Environment.
Unit is 10 out of 10 in looks and Operation.

Available for Pickup in the Atlanta Georgia area,
or will drive up to 100 miles for delivery.
Sorry, I will not ship !
I will be driving to Dayton Hamvention on May 16th
so could drop off on the way.

You can view picture of this amp at http://www.qsl.net/wd5bjq
(Menu Option Marietta, GA QTH).

Please send email (wd5bjqNOSPAM@arrl.net) for some
background and price of Amplifier.

73's,
Keith WD5BJQ

4409. Re: UHF Duplexer Tuning Experts?

Bob, first of all get away vertically from the High power TX on the tower.

Second, if you did not tune the duplexer final tuning with a return loss bridge
or network analyzer, you did not tune it...

Great rig...but not general coverage, although that may not be a concern.
Also, tube finals...6146 finals. All and all a good rig.

The 271 has tones built in. Hold down the select button and pick the tone
from the chart then push tone and it will light the tone LED and turn on the
tone you have selected.

They are an excellent rig, but do not have the WARC bands nor any way to put them into it.
The TS-830 does the WARC bands, for a little more money, you get allot more rig.

I'm only fifty four, so I don't remember the bullshit examples that you
cited, but you're probably some young punk, dumb asshole or both who has no
respect or consideration for anything but himself and probably doesn't even
know what it was like when I grew up and doesn't care because of your self
centered attitude and government-media brainwashing that tells you what to
do, how to do it, when to take your Prozac and what to think cuz you lack
the mental capacity to make your own decisions..

You make me wanna puke..

If you ever visit Europe there's a good alternative from PA0SSB in Holland.
He offers a nice full coverage, 100W HF kit for reasonable prices. But I
guess he won't send it to you since the shipping costs will be as much as
the price for the rig itself and he wouldn't be able to offer you after
sales service. You can see the picture of the designer and the rig itself on
the next link: http://home.pi.se/sm0fly/pa0ssb.htm
good luck 73

Since when is caring about other people instead of $$$ a bad thing?? I realize it has fallen largely out of vogue, what with the egocentric society that pervades these days. Life itself, let alone one's fellow human beings, has become virtually worthless.. a throwaway commodity, like a used razor... I don't know about you, or anyone else, but this scares me to death. I'll stick to the old ways, where people matter. If ever comes a time where money takes precedence in my life over another human being, it will be time for me to make my exit.

Take care, and stay well.

4425. Carrier Recovery at 1500MHz

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-03 13:36:39 UTC
From: sunny81@rediffmail.com
Message-ID: <uam1b7gr4t1h23@corp.supernews.com>

Hello all,
I need some information regarding carrier recovery at 1.5GHz. What I am trying to do is to demodulate BPSK signal at 1.5GHz. The recovery of the signal is complicated by the fact that such high frequencies the phases of the local oscillator at the transmitting end is far from ideal and hence demodulation is rather difficult. Does anyone have any suggestions/ideas/solution for this problem. Thanx in advance.

Vikrant

And don't forget the cost of a tuner which the 706 lacks. Try to find a
FT-890T which is a great rig.

Well, to be honest, most tubes are easy to get. Pretty much all the standard audio tubes are in current production, compactrons and most other TV tubes are a glut on the market, and most standard radio tubes have supply greatly exceeding demand.

The problem are some of the more obscure tubes, and sweep tubes.

And sweep tubes are a special case, and the worst possible case, and they are the problem with the FT-101. Because they were dirt cheap, designers used them (and lots of folks converted commercial gear to use them). TV set tube production was very high and there were plenty of sweep tubes out there.

Then tube TV sets stopped being made, but there were still huge numbers of sweep tubes in the warehouses.

The problem came with appliance operators who didn't know how to neutralize their finals, people who ran the finals at outrageously high levels, and the illegal CB linear crowd who often ran huge numbers of badly matched parallel tubes.

And these people collectively destroyed most of the stock of sweep tubes out there, and now they sell for outrageous amounts of money. THAT is the problem more than anything else. Tubes that should have lasted for years of operation that only lasted for hours.

Melissa...

Elecraft is about to introduce a 100-watt output amp for the K2 transceiver. It is in beta test now and I'll bet shows up for sale at Dayton. It will be built into the top so won't increase the size at all, and becomes an integral part of the radio. If you want to go back to QRP, just pull the amp and reinstall the original top which contains the battery and auto-tuner options. Takes about 3 minutes to make the change. (There will be an autotuner for the AMP as well.)

Also, bear in mind that the K2 has a receiver that will compete with the best commercial rigs available today... **WAY** beyond Heathkit's wildest dreams. The ARRL said it handles close-in QRM better than ANY receiver ever tested in their lab.

THE K2 IS NOT YOUR "TYPICAL" KIT RADIO! In A/B comparisons, I have never heard any station --under any conditions-- on my IC-756PRO that I couldn't hear at least as well on the K2, and I have been able to copy a few on the K2 that were unintelligible on the PRO. And the PRO heard a few I couldn't pull out on the FT-1000D I used to own.

The K2 feature set is outstanding and it's fun to build.

When I was in the Military we had a saying - "You trim you win".
Half the battle when demodulating any BPSK signal is to decapsulate any
remaining strong-field signal before interspersion. This having been said,
once the distance has had it's carrier amplitude modulated, a BPSK signal
above the SK density ratio will occupy greater bandwidth. My supervisor
once proved this to me by slamming me in the head with a metal mop bucket
over and over till I passed out. Then we played "Hello broom handle".I was
made to clean up the whole mess before I went to sick bay. So I don't think
demodulating BPSK signal at 1.5GHz.is going to be easy.

Hi,

I'm 16, and have been licensed for just over a year now. I currently have G5RV, and am quite disappointed with it.

My main interest within the hobby is contesting - my G5RV doesn't really cut the cake when it comes to contesting!

So, I'm now looking at vertical antennas. I was wondering how well they perform, both on TX and RX, but am looking for a vertical with the following:

- No traps
- No need for long (or any) counterpoises/radials

I have come across the GAP TITAN DX, but if anyone knows a good performing vertical antenna, would they please let me know?

Many thanks.

73...

Hi Simon,

Almost across the board, GAP products do not provide very useful
performance for the lowest band offered. That is, if the model is
built for 80M, it probably will only begin to work on 40M. They may
load suitably, but still not perform very well. Once you move to a
higher band, things improve, but not beyond the expectation of a
common quarterwave vertical.

The simplest advice is to put your antenna higher, and build it bigger
(but not too big, 5/8ths is the largest you should attempt for a
vertical). Height is the most important. Sacrifice everything else
(until the antenna becomes too small, less than 1/10th wavelength) and
make up for it with a tuner.

You will undoubtedly get good advice in regard to your G5RV here, and
the alternatives to it like Cecil's tunerless dipole. I mention this,
because as bad as you think it is, it will probably prove to be more

useful than a GAP.

I can only compare the G5RV against an R5, but I'd take the G5RV anyday. It performs heads and shoulders above the R5. I have had my G5RV up for about a year and it has worked great except on 40 meters where I can not obtain anything close to resonance.

>G5RV, and am quite disappointed with it.

Congrats on the licence.

Be aware that the antenna of which you speak was designed as a
compromise all (pre-WARC) band antenna with a low-enough SWR for the
valved PA transmitters of the day. There are those who say it is not
really suitable for a modern solid-state transmitter. Even with an
ATU, some of the compromises remain, such as radiation from the feeder
on certain bands.

>My main interest within the hobby is contesting - my G5RV doesn't really cut
>the cake when it comes to contesting!

I'm not in the least surprised.

>So, I'm now looking at vertical antennas. I was wondering how well they
>perform, both on TX and RX, but am looking for a vertical with the
>following:
>- No traps

You mean not necessarily any traps.

>- No need for long (or any) counterpoises/radials

I'm afraid that you _will_ need radials, even for a ground mounted
antenna, unless it is a half-wave. A vertical is form of monopole, and
it needs something to work against. This is either the planet Earth,
or if mounted on a mast, a set of radials. Radials for ground mounting
help the antenna connect to planet Earth, and reduce losses (mainly
resistive).

But there are other problems with verticals besides ground losses and
inefficiency. Noise tends to be vertically polarized, and as the
radiation pattern is omnidirectional and vertically-polarized, a
vertical will collect it all. There's no front-to-back ratio of a beam
to help you here. Field-strengths locally can be higher than a beam,
leading to the possibility of EMC problems.

But it's not all doom-and-gloom. A vertical can illuminate the
ionosphere more evenly than a beam, and - with plenty of radials! - a
low radiation angle and reasonable efficiency. You can take advantage
of this by being ready for the band of interest opening for you for
the DX, before the boys with beams. But you could have as little as

ten to twenty minutes of this; it also operates this way on band closing. In between, of course, you're going to be outgunned.

>I have come across the GAP TITAN DX, but if anyone knows a good performing >vertical antenna, would they please let me know?

I've tried to say above that ALL antennas have strengths and weakness; advantages and disadvantages; a named antenna hasn't necessarily any advantages performance-wise that one you make yourself. What you MUST do is a bit of background reading about antennas, finding out their individual characteristics, and finding which one(s) will help you in your goal. There might be one type of antenna that can do more things for you than another, but none will do everything.

In engineering terms you need to define what service you need from your gear, and then find what components - antenna in this case - will fulfill that. When you've done that and are getting the results, you will have engineered a solution, and learned much on the way. There are no 'silver bullet' solutions!

I hope you find this of use.

Good luck with the contesting.

I was under the impression that the feeder (the ladderline) was SUPPOSED to radiate, which is why I got such good results with my G5RV against both vertically and horizontally polarized contacts. I could be wrong.

> The TS-830 does the WARC bands, for a little more money, you get allot more
> rig.

I concur...The 820 is a real good rig, but the 830 is a good bit
better. Also you have the option with the 830 of using the vfo-230
which will make the rig stable as a rock. The 820 can't use this VFO,
and thus will always be slightly drifty with room temp changes. And
also as noted covers the warc bands. Also a couple of extra receiver
goodies such as VBT, etc. I have a 830/vfo230 combo I'm thinking of
selling, but I'm not sure if I want to ship it. Thats a hassle.. My
plan was to take it to the Belton TX. hamfest and try to hawk it off.
I hate to sell it really, but I need $$$ for other stuff I'm messing
with. I can use my 706 until I get something else. I'm still pulling
my hair out trying to decide to sell it or not. I know I'll regret it
once it's gone. I may end up keeping it... It is a dang good radio
with a good receiver..Mine has the 500 hz cw filter also. With the VBT
that dials down to about 150 hz. That will keep up with most of the
new radios on the block. It's almost too narrow...I usually dial it to
about 200-250 hz. MK

You're quite right. What I was getting at was that the radiation
pattern might not be what you think it is, and you could be trying to
work DX in a null rather than a lobe with some gain. There could also
be noise-pickup on the vertical section. But I was also trying to keep
it simple. You can't teach 'antennas' in one posting...

Hello Simon,
I would have to suggest against - any vertical - antenna...especially in a competitive contest environment as you have stated is your intention. I have had super success with a simple 5-band resonant wire dipole built and sold by W9INN Antennas (W9INN-Bill) The Official W9INN Antennas Web Page is located on the web site listed below in my sig line. Here is what you'll find there....

The Official W9INN Antennas Page is located at....

http://www.ab7sl.com

1. contains actual measured field data
2. detailed illustration - 5-band resonant legal limit dipole
3. special " resonactors " page w/description by W9INN-Bill
4. antenna dimensions
5. contact and ordering information w/tel#

I have 307 DXCC countries on this "dipole" antenna!!
Good luck on your antennas pursuits and in contesting.

>
> -=-
> Alan

It doesn't really matter. The battery acts as a huge cap and smooths
out all the ripple. I use a regular old sears diehard battery
charger." automatic". The only thing you need to do is have real good
connections. If the connections get corroded to the battery, in some
cases the rig will be running mainly off the charger with a bad
battery connection. In that case, yes , you would get ripple. But as
long as you keep the connections real clean and tight, no problems. My
present charger is a 2-12-75 amp auto charger, but I used a cheap 3
amp trickle charger for years. 3 amps will keep up with a 100w radio
as your transmit duty cycle normally leaves enough time to get back up
to charge while receiving. I just bought a big one in case I ever want
to run a solid state amp. In that case, I would probably parallel two
batteries and charge on 12 amps setting. With my barefoot 706, I use
the 2 amp charge setting. It will actually charge up to about 4 amps
in that setting if the drain is high. MK

Actually - no!

If the G5RV is reasonably symmetrical in the air without too many
obstructions around it, and it is tuned with a properly balanced tuner then
it will NOT radiate from the feeder on any bands.

If any of these conditions are not true, however, then there may well be
some imbalance in the feeder and radiation will result - but not by design.

ANY multiband antenna of any construction, shape or design is a compromise
over a single-band, single purpose antenna!

Now, to the original question - I have an 80m dipole with tuned open-wire
feeder at 35ft and a GAP Titan mounted in a reasonably clear spot on flat
sandy soil. On all bands from 40m to 10m the GAP is at least as good as the
dipole, and on some bands for certain QSOs is better. DX performance on 40m
& 30m is generally better on the vertical, but mainly because of reduced
european signal levels. As somebody said before 80m performance is poor on
the GAP. Its not a mirical antenna, but its at least as good as any other
multi-bander and has a good bandwidth on all bands except 80m. It also

costs a lot of money ... a lot more than I had when I was 16!

Neither of these antennas will be competitive in large contests on any bands .... you need a 3kW amplifier and all controls turned to maximum (especially the speech processor) to join in! (It also helps if you listen on the frequency before transmitting, but that appears to be optional!)

Well, I wanted to be HIGHER on the tower, but the people mounting things
didn't know how much coax was left, so the planted the antenna at 400 feet
and I ended up with 50 feet of coax in my garage.

As far as I can tell, the FM transmitter is giving me absolutely no trouble.
It's 200 feet higher, is a 4-bay circularly polarized, and the signal
directly below it should be minimal, so to speak. Now I haven't turned it
off and on to watch what effect it has, even though I'm licensed to do so;
the radio station people probably wouldn't ever let me up to the site if I
did that myself. I might conduct such an experiment with their engineering
staff at some point, however, and a spectrum analyzer on the antenna coax
would be interesting to watch. Fortunately, it's a 20kw transmitter loafing
along at 10kw and they're getting the maximum 50kw ERP out of the antenna I
believe.

I do not have access to either a return loss bridge nor a network analyzer,
however I did tune it. Now you may argue, probably successfully, that I did
not tune it OPTIMALLY, to which I'd most likely agree. But one does the best
one can with what's available. While I might squeak just a bit more signal
through it, I really can't complain at over 100dB of frequency notching,
while losing what seems to be about 1dB of transmitter power. So something
must be awfully close. Perhaps in certain situations, or where the band is
crowded or heavy with intermod, more critical tuning would be necessary.

Source record: 45157

As others have mentioned, the 820 is a good rig. Even without the WARC bands, its performance beats lots of the current market rigs.

The 830 is better and the price difference on the used market is not much. Most 830 in good condition will go for $375 to $425 max.

I got one used out of Denver 3 years ago for $400 in great shape.

The 830 is also easy to work on. I have added AM mode to mine (sacrificed the CW narrow position on the mode switch) and will be putting FM mode on it later this summer.

I have heard of drift problems with the internal VFO but mine has always been rock solid.
Will deal with the root cause if the problem ever shows up....

73 and good hunting...

The WARC bands can be added to the TS-820. I did that back in the early 1980s, using an article that appeared in QST on the subject. It worked very well. I wouldn't recommend attempting it unless one has a bit of experience and understanding into how things work, but it is certainly possible. The TS-820 was plagued with design deficiencies - well documented in the Kenwood Users Group newsletters of the period (still available from International Radio). Unfortunately, the fellow who designed many of the improvements (W6TOG) and sold the associated parts, has passed away.

There were many problems associated with the digital display, caused by cold solder joints on the digital board. Fixable, but not for a beginner.

Amp Supply Co. LA-1000 HF Amp. 160-10m

Have for sale or trade an Amp Supply Co. LA-1000 HF amplifier. Late 80's model, with Ameritron serial placard. Manual states 500-600w output. Tubes are doing about 450 on 80m. Amp is in good shape and working perfectly but has a few scratches. Power switch has been replaced with incorrect but heavy-duty switch. Looking to sell or trade for a Dualband mobile such as TMV-7A or similar. Will only consider Icom, Kenwood and Yaesu mobile ham radios depending on mod availability. Will also consider only Motorola/Radius handhelds or mobiles (Max, GM, M1225, etc) as well. Jedi, Radius or Pro series. Asking $275 plus shipping. thanks and please reply direct,
Randy, KC8CPK

Simon,
Any antenna will benifit from having a good ground
under it, the 'Gap' antennas also. While I'm not much
of a 'G5RV' fan, it will work as well, or better, than
any of the 'no-radial' vertical antennas on the market.
As someone has already said, elevation will do more for
you than anything else will, with the G5RV.
The 'Gap' antennas may not have the 'classic' style
of traps, but they do use devices that serve the same
purpose, and have about the same 'losses'. The 'trapless'
thing is a sales gimmic, and should be treated as such,
lump it in the same catagory as their 'gain' figures...
'Doc

Two questions for you on the W4INN antenna:

1. It looks like the 15M and 40M elements just hang down - Don't they twist in the wind and end up all tangled around the mian wire ?

2. How well would it perform if hung vertically ??

Hello Recticulum,
>Two questions for you on the W4INN antenna:
It's W9INN Antennas not W4INN - just so readers will know....

No it doesn't twist or wrap around itself in the wind. The wooden
dowel spacers (about 12 inches long) keep the
elements in place and after nearly 6 years of use I have had no trouble
like that or any maintenance of any kind. According to the free info
available from W9INN it can also be hung vertically or even as a sloper.

The W9INN Antennas Page is located at the website listed below....

Verticals radiate equally poorly in all directions.

If you are not able to put up a tower with a beam, put up an all-band dipole. You will need 135 feet of antenna wire, 100 feet or so of open-wire lead (ladder line) and an antenna tuner to match the unbalanced output of the transmitter to the balanced line.

Feed the 135 feet of antenna wire in the middle with the ladder line.

Look around the various ham radio sites -- the AC6V site is a good place to start -- and you will find dealers selling an already assembled all-band dipole.

Hi all:
I just hate to see anyone buy a dipole. Any ham should be able to make a dipole. They are so easy to make, even ones like the W9INN dipoles. They are not "magic", they are just normal dipoles. I'm sure that he makes them very carefully and the like but gee it's so easy to do it yourself and you also learn a little bit. In dipoles like W9INN's the main "secret" is to tune the lowest frequency wire first and then the next lowest and so on. The main disadvantage to the W9INN style dipole array is there is a lot of coupling between elements which means that cutting can get a bit fussy but its not that hard. Try it, you can make one just as good yourself. Even shorted dipoles and trapped dipoles are not that bad to do. I will admit that an antenna analyzer and an antenna modeling program like EZNEC can help by cutting down on the amount of cut and try.

Hello John,
I think you may be over simplifying a tad on the W9INN multi-band resonant dipoles. Bill-W9INN uses resonactors as band selection devices.....it is more involved than just 'cutting the wires" and also with resonactors the element "coupling" as you call it is eliminated. Resonactors are explained on the W9INN Antennas Page of my site which is listed below in my sig line

But just for the record John.....can you explain what testing method you used and also exactly which W9INN antenna was analyzed so that you were able to measure, record, and publish your claims as you have now done so here? Just the facts - OK?

Believe it or not, there are still places left in this world where people leave their front doors unlocked, even when no one is at home. I used to work in one of these areas, which is a small semi-rural community where everyone knows everyone and trust runs high among the locals. When people made appointments for me to come over to their houses and they couldn't be home, they would just say "the door is unlocked. He knows where and what needs to be done. There's a beer/soda pop in the refrigerator. Just tell him not to let the dog/cat out and pull the door shut when he leaves..

I knew a lot of the people on a first name basis, the dog in the backyard, seen people's hidden contraband, marijuana plants, etc, and virtually had free run of the whole doggoned area, pasturage, wooded areas, etc without having to worry about getting shot at for wandering into the wrong place..

Because my boss was a jerk, I left that job for another one "over the hill" in "civilisation" which offered a very substantial increase in pay, but I still miss the people and the laid back and virtually stress free work atmosphere which I had held onto for five years because in many ways it was worth more to me than all the money in the world..

Maybe that exists somewhere now, but the current risk is that the same openness will have you sitting behind bars when some doper whines to the police that you stole his dope. Did I say risk? That was a risk 20 years ago...its almost a norm these days that a serviceman left in the house has stolen something.
I hitchhiked the whole country in those days...I wouldn't dare hit a highway now. Things have indeed changed and thats a sad comment on our society. Its a great memory, tho.

Hi folks,

PHEW! Thanks to everyone who replied to me, both personally, and through the newsgroups.

I've had quite a mixed response from people saying that verticals only work best for over the sea, and horizontally polarized antennas work better over land.

But I've had people saying that the GAP works well, on all bands, both on RX and TX for DX only (EU stuff on the 5RV)! Oh and the Force 12 Sigma-V vertical.

I have also been pointed at the 'CobWebb' antenna - which is claimed to have 5 - 7dBi gain on all bands. The ham which pointed me in the direction of this antenna... Take a look at http://www.g3tpw.ukgateway.net/ - although I'm limited for space, I

might just about get away with this.

Looks like I might stick with a horizontally-polarized antenna for now - looks like they may be best for contesting. Has anyone else got any more suggestions?

Thanks in advance,

73

Simon

I use a half-wave dipole cut for 40m at about 8m agl (supported under
the eaves
of the house) and fed with twin-feeder into an MFJ-948 tuner. The rig I
use is a
Kenwood TS-450S. The dipole isn't straight by any means - the last
approx 4m
of each leg are bent by about 45 degrees so that they can be supported
by nearby
trees. However, I can operate successfully on all bands between 40m and
10m.

It may not be a world-beater, but I ran in last weekend's WPX contest
(SSB) on
40m through to 10m and managed 500 contacts in 76 DXCC entities - so it
can be
done.

All the best and good luck with the contesting.

Best Regards

John Hague, G4GOY

Simon
been out of the country for a couple of weeks but missed the threads
so hopefully this isn't a mere repeat of other folks.

I use G5RVs quite often at temporary stations - they are not my favourite antenna but do allow simple operator as most inbuilt rig ATUs can tune them. I usually find the coax feed length critical if they are to be tuned OK on all bands (normally we have a problem with 15m, sometimes 10m).

For real contesting you will need a directional antenna and, of course, for worldwide contesting, it needs to be steerable. Don't know about you but I have neither money, nor space, nor neighbours for a 3 ele beam on 20m let alone 80m.

IMHO the best simple antenna is a doublet, ie a dipole fed with ribbon line to a balanced ATU. The John Hey book Practical Wire Antennas has details of lengths to avoid. I run 102' doublet fed by commercial 450 ohm ladder line. Ideally this should go to a balanced ATU but because I need to feed it via coax to my XYL's shack as well as mine I terminate the ladder line outside with a commercial (Radio Works) 4:1 balun and use a very short coax run to my Elecraft K2 inbuilt ATU. This seems to work pretty well. My previous antenna was a windom, again with a 4:1 balun, this time at the feedpoint, with coax to the rig. I think the doublet is marginally better (I have it about 8' higher at 35' which also helps) and between them I have 150+ DXCC countries on 10W SSB.

As a comparison I also have a Cushcraft R7 vertical. This tunes up on all bands 40-10m without the need for an ATU and gets reasonable reviews for a vertical - it has the plus point that it doesn't require ground radials. I typically got 1-2 S-points more on the Windom and now 2 S-points more on the doublet. Occassionally the R7 performs as well or possibly mariginally better than the doublet (particularly on 40m) depending on direction and skip.

Hope this is of use.

And for that, you are talking about a minimum of 100 buried radials.

You are trying to paint a 16 color picture with 1 color. What would be
good will depend on the band you prefer. I get the hunch you want all
of them, but getting "contest buster" performance on all bands with a
single antenna is gonna be tuff. I'm not a great fan of the GAP
designs. They use intentional resistance to get a better match. Also
they claim that elevating the feedpoint cuts the need for radials.
Don't believe it. Myself, using intentional resistance is something I
can't quite stomach. You have enough problems with unintentional
losses to need any extra. Mostly ground losses with a vertical.
Being you don't want radials , I would totally rule out a vertical
unless you use an elevated "1/2" type vertical like the cushcraft R7
or whatever. For 20-10 meters that will give you the best performance
with no radials. The higher, the better. What you probably should do
is improve the wire antenna you have.
Maybe concentrate on fewer bands , so you can use better antennas. A
regular coax fed dipole using no tuner will seem like a miracle worker
compared to the average G5RV with the tuner losses it has , and the
stuff they stick in the feedline. You can use some on more than one
band. A 40 meter coax fed dipole will work 15m pretty well. The SWR
might be a tad high, but you could lower that with a tuner.
At least you know that most of the power that leaves your radio or

tuner will make it to the antenna and radiate. The losses in coax with a low SWR are very low on the HF bands. You have many options for good antennas with some gain, but they tend to be single band unless you use ladder line. Say you like 20m... Try an extended double zepp. Thats good for nearly 3 db broadside. Like 10m? Most 1/2 and 5/8 wave CB antennas work well on 10m. They will outdo most multiband amateur verticals by a sizable amount. A small yagi even better.
If you like 80 or 40 meters, I would stick with coax fed dipoles. Don't use a tuner. You can run both sets on the same feedline if you want." Parallel" Will work much better than the average G5RV. 80m, no contest. Of course, for the low bands, a vertical is usually best for long haul dx, but you need a REALï¿½ vertical with lots of radials under it. I mean like 30-60 for a ground mount. If you can't deal with that, I'd stay with coax fed dipoles. Thats the best you are going to do on a fairly small scale. If you must have an all band antenna, I'd use a 130 ft dipole fed with 450 ladder line the whole way to a good tuner. Or use Cecils no tuner method. Always use the least amount of inductance to tune. Using too much will cost you 20% of your power in many cases. This is why I prefer coax fed and no tuner. Even using the least inductance, I can still tell a difference. You waste very little power with coax. I ran a coax fed dipole at 40 ft for 20m SSTV and I don't think there was a single time anyone couldn't hear me. I worked many dx stations with 40w of video. They didn't receive snow flurry pix either... :) If I'm S7 with the dipole, I'd only be about 1-1.5 S units stronger if I was running a full size 3 el yagi at the same height. Only with very weak signal levels would it be enough to make a real difference.
You'll never be as loud as the big strappers with big tall yagi's and 1500w amps, so get used to waiting in line. You can make it once they get through. MK

I dont know if you said the exact model number of your duplexer but response curves very far away from the tune freq on a pass-notch type duplexer is "uncharted territory" If your are experiencing desence or mixing in the RX from high level signals
far removed from your freq it is best to install a real bandpass only cavity at the input of the RX after the duplexer. You dont really need all that fancy equipment to tune a duplexer, it may help to squeeze out that last undiscernible DB of meet published spec. but will be unnoticeable in operation. Just do some simple tests for internal desense and then external desense when putting it in the air.

> Will deal with the root cause if the problem ever shows up....

That means you have a stable room temp. The kenwood analog VFO's are
electrically stable, but not temperature. Also it helps to have the
power supply mod done. If you have a gold label, it's already done.
Easily done to a silver label if it hasn't been. In my case, I have a
1 ton AC right next to me here in the shack. Every time it cycled off
and on, I'd drift about 40 cycles up and down. Like to drove me crazy,
and I would have sold the 830 if I hadn't found the VFO-230. That VFO
is rock solid. Will make the 830 like a 930 as far as stability. Not
to be confused with the VFO-240 analog external VFO. It's not as good.
Also the VFO-230 has 5 memories. Neither of my icoms drift enough to
notice. Even my old 730 was fairly stable with AC cycling. It might
have moved 5 or 10 cycles... No biggie..Wasn't enough to notice on
SSB. My TS-520 had the same drift. In fact all the hybrid kenwoods do
and even the TS-120,130, and even maybe the 180 drift with temp
changes. For instance the VFO in the 830 is the same as in the 130. Or
pretty sure anyway.. MK

Dear Simon,

Your G5RV will be improved by replacing the coax with
more widowed twin line and using a balanced ATU. You
may have a rig with a built in ATU but these don't have
the amount of adjustment needed to tune up all bands.
They are really only useful for matching to a linear
or correcting a slightly off resonance antenna. Have
a look at
http://www.cebik.com/
for the best on-line antenna info.

Other replies have pointed out some of the advantages
and disadvantages of verticals. If you live close to
neighbours you may find that a vertical causes many
more EMC problems than a horizontally polarised antenna
and, as others have stated, will pick up a lot more
local noise.

The G5RV may well radiate from the feed line as it is normally driven unbalanced. A doublet will be more effective if it is driven balanced and it will then only radiate from the antenna and not from the feed line.

==========
Walt, nonsense !

With a 1/4-wave vertical, 99 times out of a hundred 8 or 16 or 32 at most
are quite good enough. You've been plagiarising the old wives utterances yet
again. ;o)

I think KB7QHC is right - you are unlikely to be much happier with a
vertical than you are with the G5RV. (and I'm sure the G5RV was much less
expensive!)

One antenna I've had surprisingly good luck with is a Windom. It's a
dipole, but off-center fed. 26.8m on one side, 13.4m on the other. Use a
4:1 balun, either at the feedpoint or connected to the feedpoint through
some length of 300-ohm flat TV antenna feedline. I'm told (but haven't
tried) that you can halve those dimensions if necessary - losing 80 meters
but not affecting the other bands.

That's what I use on my second radio for two-radio contesting. It's no
competition for the tribander, but it's pretty effective. Whether it would
beat a G5RV I don't know.

It's my understanding that the number of radials is
also dependent on the height of the verttical above ground.
That is, the feedpoint. Furthermore, the greater the height,
the lower the take-off angle; a key consideration for any DX
work.

With dipoles it's *horizontal* length that's needed.
I can't tell how you many times I've sighed when I read
someone saying, " First you string 135 ft. of wire."
So easy to type, so impossible for many of us to do.

I use trees for height and support, but they also lock
you onto anchor points that may leave your broadside working
OX and you working the world off your dipole tips. Dog-legging
effectively destroys dipole gain. Using comm'l towers implies
serious money for any real height. Using Beam-type antennas
like Quads and Yagis locks you into fewer bands unless you
have both money *and* real estate. Using homebrew masts can
often mean loss of real height and still may not be practical due to
trees or other obstructions. And let's not forget we loose a chunk
of the yard as we dare not cross the dreaded power line !

In other words, this is the fun-stuff !

Hi all:

Well perhaps I could have "over simplified", but traps and loading coils are still traps and loading coils even if you come up with nice marketing names like "resonactors" or as Alpha Delta calls them "ISO-RES" inductors.
They are still dipoles, they work no better than any dipoles. Don't get me wrong, I have no problem with trapped and loaded dipoles. I made my own for 80/40/30m which looks very much like the W9INN antennas. I am well aware of the trade offs in that type of antenna. With careful construction and design they work so close to a full size dipole that it would be very hard to tell them apart even with a well equipped test range. My dipole is up about 35' and I've worked 87 countries on 80m in the last 5 months.
It still puts most of the power straight up, so I also work states around me well too. It works just like EZNEC predicted it should.
My main point is that dipoles are a simple antenna, and any Ham should be able to build one himself that would be indistinguishable from ANY commercial dipole at his location, and height.

I have to agree. I not only haven't got the room to put up a dipole (unless 16' counts!), nor a G5RV, or any tree to hide anything in. I am prohibited from putting up any kind of outdoor antenna whatsoever. So anything I can manage to stick up has to be disquised. You've heard of the antenna that looks like a flagpole, well I have an antenna that looks like a hedge! I have no wire fencing to support anything. I can run a longwire against my brick wall, but we know how well that will do. I would love to try the Isotrons but they are so expensive. I just keep trying different types of hidden antennas until I find one that works. They ALL receive well but don't radiate worth a darn. This is what I love about the hobby.

Anybody got a spare 20m Isotron laying around they want to see put to use?

I understood that on some lower bands the feeder was
designed to radiate; I would be grateful for a bit more detail on
this. Should the feeder radiate, then as I said , there will be
noise pickup on this on receive, which will degrade the signal-
to-noise ratio.

> If the G5RV is reasonably symmetrical in the air without too many

> result - but not by design.

Well, there's many ifs and buts there! And modern gardens
generally don't have so much clear space. But we don't know
the original poster's situation as far as that is concerned.

> ANY multiband antenna of any construction, shape or design is a
> compromise over a single-band, single purpose antenna!

Of course it is.

> Now, to the original question - I have an 80m dipole with tuned
> open-wire feeder at 35ft and a GAP Titan mounted in a reasonably

> certain QSOs is better. DX performance on 40m & 30m is generally
> better on the vertical, but mainly because of reduced european
> signal levels.

I'm sorry to say that the statement that "On all bands from 40m
to 10m the GAP is at least as good as the dipole, and on
some bands for certain QSOs is better" is the sort of
sweeping generality that ignores the fundamentals and as a
consequence gets some antennas a bad name where it isn't
deserved, and some a good name that isn't deserved either.
You are simply comparing apples and oranges here. Your
'dipole' (by which I think you mean a doublet resonant on 80m)
has a variation in radiation pattern as a function of band that

simply doesn't exist in the same form with a vertical. On some bands you could be operating with a major lobe (with gain!) to a target area, and on a different band the same target area could be in a null (with negative gain!). This alone could give rise to the basis for your statement, but it isn't as a comparison of a vertical and doublet on otherwise equal terms - it is as a function of the changing radiation pattern of the doublet!

This is why I said to the original poster to mug up on antenna radiation patterns, decide what he can put up in his own particular location, and operate accordingly using the advantages of the chosen antenna to the maximum, and being mindful of it's disadvantages

> As somebody said before 80m performance is poor
> on the GAP. Its not a mirical antenna, but its at least as good
> as any other multi-bander and has a good bandwidth on all bands
> except 80m. It also costs a lot of money ... a lot more than I
> had when I was 16!

Biut WHY is 80m performance 'poor' for the GAP? Over what ranges? Day or night? Seasons? These are all important factors. What other fundamentals are being ignored here - if any! I'm not familiar with this antenna, so can't really comment apart from raising the obvious questions.

> But it just could be Neither of these antennas will be
> competitive in large contests on any bands .... you need a 3kW
> amplifier and all controls turned to maximum (especially the
> speech processor) to join in! (It also helps if you listen on
> the frequency before transmitting, but that appears to be
> optional!)

LOL! I've got to agree with you there. But I also tried to say to the original poster that with a system designed by him, where its good and bad points are known and explored, he could have a reasonable shot at contesting; but he'll have to bear in mind the points you've just raised. It boils down to station design and operating skill, something one has to learn....usually the hard way, but not necessarily expensively so. And picking the right contests - about which I can't offer any advice.

Thanks for responding, I quite enjoyed this. I hope we haven't left the original poster behind or forgotten his needs. As I said, you can't teach it - or learn it - all in one posting. Antennas can and have formed the basis of lifelong experimentation for some amateurs. It's a topic I personally find fascinating.

Hi and thanks for reading.

I have a friend in need of some Rotor info. I'm including the information he gave me. I've not seen them to ascertain any further details. So, I hope you can go from what you see here.

Rotor 1 - Ham 2 - CD 44

Rotor 2 - A CDE model, but not sure which... Info is - SA22L stamped on it. Then there is also TRA-4 stamped on it, with the numeral 2 under the dash. My Sams Index shows no CDE TRA4.... It shows a TR/4, but not sure if one and the same. I can not find any CDE info in my files. Only Alliance.

He is in need of all info for testing and repair of these two models. IF you have it on hand or know where we can download it, please let me know directly.

Thanks again.

Hi Doc,

I have operated with a Gap for years and have noted absolutely no loss
whatever. Could you elaborate?

Hi Mark,

Having assembled and used a Gap, I must've missed that resistor.
Where does it go?

Simon,

Well, by now you've probably noticed several things:

1. That you got a lot of educated responses to your query.

2. That most of them were confidently presented as the " last word."

3. That many of them seem at odds with each other, so now what?

Welcome to Ham Radio ! I absolutely promise that any antenna thread,
if it should continue long enough will get increasingly opinionated and
end up in a flame war eventually. The outcome is rarely for the sqeamish.

So what's my two cents worth? Well, I would emphasize what maybe
others have implied without always saying: You and your unique QTH are the
deciding factors. All the design in the world won't squeeze a 200ft. tower in a
townhouse backyard, etc., etc.

I would urge you to do a lot more careful measuring. You need to view
your lot as a series anchor points and elevations bounded by property lines. You
must think in a 3-D fashion. You might even find it real fun- like a puzzle !
Even one tree and one roof offer myriad possiblities. An IMPORTANT consideration
to remember is that while that broad-band dipole might have a pretty figure-8 on
one band it might have annoying minor lobes on the frequency you'll use the
most. Furthermore, while the major lobes at one freq. may be pointed at your DX
target, on another freq. that target may be lost to you because those minor
lobes have killed your ability to reach that DX. What works well to Europe on
one band could end up pointed at Greenland on another using the same antenna.
No kidding.

Your best tools outside will be a tape measure and a compass. You need
both. Don't guess your headings because remember your major lobes will alter as
you move from band to band. Your best tools inside are caculator, PC, internet
and however many books you've time and energy for. The time spent actually
building and hoisting your antenna should be no more than 15-20% of your total
time on the project -- even if you buy a commercial one. The Cobweb doesn't
impress me personally because it looks like the reason it radiates equally well
in all directions is because ot has gain in none of them. Dipoles are the
cheapest and easiest gain-for-money there is; Why throw it away ??

BUT BE WARNED:

Because if you do your homework properly you're going to discover
one of the TERRIBLE TRUTHS of Ham Radio; That, as we gain experieince
and knowledge, ultimately the sum of our talents and abilities will exceed what

our time, our money, our families, our real estate, and our community allow.
And nothing will get you through that wall.

(You said you're 16; If you're sharing this with your Pop he might tell you
there's a lot of other things in life that work just like that. Just ask him.)

I'd be surprised if you're happy with the performance of an Isotron,
tho it will be better than nothing. Better to make up a short dipole.

A couple years ago there was an article in Worldradio magazine
describing a dipole with sprialwound end loading coils that was only 12
feet long on 40 meters, and could be about half that on 20. If I recall
the total length of the antenna elements plus the spirals equals a
halfwave. I don't have a reference at hand, maybe someone does. It used
aluminum Radio Shack ground wire for the spirals. You might be able to
make up one of those and hang it out an upstairs window when you want to
operate, or just temporarily mount it as high as you can
on the ground and take it down after use. Something you can come up with
will work well enough to get you on the air. Keep trying.

Rubbish. The more the better. One radial per degree (=360) isn't too
many. And it isn't a factor of two either.

==========
Dear RVMJ,

Wrong ! When a 1/4-wave vertical is 1/2-wave or more above ground there is nothing to be gained by having more than a single 1/4-wave radial. I know it's difficult for a non-mathematician to take in, but you can't have anything more than 100% efficient.

> to-noise ratio.

The original design of the G5RV is a 3 half-waves doublet for 20m - on which band it can be outstanding in the favoured directions - it is not a compromise antenna here by any means! On the other bands (exc WARC) the feeder length & impedance has been carefully choosen to present a 'reasonable' match to a valve amplifier - certainly one that can be tuned out.

Modern transceivers will always demand a better match, therefore a tuner should always be used - and preferably a balanced one. (Note, most if not all commercial ATUs are not balanced. Some have a balun at the antenna input which is a pretty dodgy trick on high impedance or highly reactive loads).

Under these conditions there is no *intended* feeder radiation.

Many articles on the G5RV show it being used with the feeders strapped together and tuned against ground on 160m. This of course is ALL feeder radiation, and none off the top, but its not a G5RV anymore, its a top-loaded Marconi vertical!

Absolutely - coupled with the fact that "commercial" G5RV antennas (I really don't know why people pay all that money, but there you go!) have a coax

transformation at the end of the ribbon feeder and if tuned at all will be by an unbalanced tuner - so in reality a good proportion of G5RV antennas will exhibit feeder radiation, and hence behave differently from that predicted.

I agree completely - as a professional radio engineer! Its simply an operational observation, and as you point out is pretty worthless, other than to verify that both antennas are obviously working!

By way of defence I once had a small vertical antenna with a trap in it - and this performed consistently worse than a horizontal dipole, so subjectively I concluded that the trap was contributing a discernable loss.

By making such a sweeping statement you might at least deduce that you wouldn't be completely wasting your money!

> You are simply comparing apples and oranges here. Your

Quite right - and also the vertical antenna to boot - which is affected by its surroundings up to about 20 wavelengths away, which in my case includes houses & trees!
>

Excellent advice - and that is why I have a great circle map on the back of the door with all local obstructions & antenna orientations for my garden marked up on it!

> apart from raising the obvious questions.

All good questions - but fundamentally this antenna is too short to be an effective radiator at this frequency - though it does resonate as designed, and is quite effective as a receive antenna as the Eu/DX noise ratios are different (another sweeping generalisation, of course!)

I agree - I am moderately successful at some HF CW contests - by picking ones which match my limited availability & equipment. eg a short European contest with a 100W section where predominant QSOs are on 80 & 40 - operated with a lowish dipole can give a good placing.

The best contests are those where high power & big antennas do not dominate all the tables .... try ROPOCO this sunday morning on 80m for example.

> and have formed the basis of lifelong experimentation for
> some amateurs. It's a topic I personally find fascinating.

Yes - I've been playing with antennas since 1973 and still have a lot to learn. Apart from VHF yagis the only antenna I ever paid real money for was the GAP vertical - and that was because I was living in a block of flats at the time in another country and needed something which was fed with a single coax from 5 floors below, worked on all bands and was simple to erect. Most of the time its suck it and see, and its very difficult indeed to be objective about performance. However, one field day some years ago I designed (as in with sums and theory!) a 4 element vertical antenna for 40m, fixed on the USA. Everything checked out on site with a field strength meter, but it wasn't until about 2 am when we had the first call from the US that I really know it was working ... we switched from the standard 40m

antenna (a delta loop) to the beam. The European noise all but disappeared, and the US signal hit the end stop! Now, that was job satisfaction. We didn't win NFD that year though, only came second! (G3RAC/P in case you are wondering).

Thanks for the oportunity for the debate - but why the secrecy?

Hello to the list,
I have come across an old (very old) battery operated receiver. Similar to Atwater Kent, with three tuning dials, volume control, and filament control. There is also an off/on switch. The tubes are all 201, type A 4 pin. The name, engraved on front panel is either: "Voldistone, or Doldistone". With the style of print, it is very difficult to decipher the lettering. Any help in identifying this receiver will be greatly appreciated.
Thanks

Thats silly. The only type of ground that really matters is whats
under the antenna, and the ground quality in your local area as it
apples to the far field.
What really matters assuming both types are properly installed, is

what band, distance, time of day, etc. I'm on land and I use both at
times. Which I would use will depend on the distance and path. On 40m
I ran a dipole at 36 ft, and also a full size 1/4 wave ground plane at
36 ft. if I were working regional distances out to about 800 miles,
the dipole will almost always be better.
Past 1000 miles the vertical would almost always be better. At 1500
miles at night, the ground plane would be 2 s units stronger than my
dipole. From Texas to VK land, 4 s units. But if I woke up the next
day and decided to work Dallas from Houston, I better get on the
dipole if I want the best signal. As you can see the ground doesn't
mean anything as long as you take it into account when designing the
antenna. If you are on lossy earth, that just means you have to use
more radials to reduce the ground losses to an acceptable level. As
another comparison on 40m, lets compare my 9 ft mobile antenna on my
car to my 36 ft dipole at the house. Everyone knows the dipole is much
more efficient. Thats a given. But that still doesn't stop my mobile
antenna from outdoing my dipole at 800 miles or more at night. Why?
The radiation from the mobile antenna just happens to be strong at the
angles I want when talking that distance. Being the dipole at 36 ft
shoots mostly straight up or at fairly high angles, it loses in that
case. This blows the whole ground vs water, etc theory out of the
water. My mobile was sitting in front of my house in the driveway, not
at the beach. It would perform better at the beach, but it's certainly
not required.
>

> Sigma-V vertical.

The GAP might seem to work ok if you have nothing better, but believe
me, as antennas go, it's pretty lame. I wouldn't stick one up if
someone gave me one free. I'd sell it and build or buy a real antenna
that has no hidden resistances.
>
> I have also been pointed at the 'CobWebb' antenna - which is claimed to
> have 5 - 7dBi gain on all bands.

Whoever claimed this is on some kind of drugs. Or they use the effects
of ground to "bolster" the antennas performance without mentioning
they are including ground effects. I hate it when people do that.
Really irks me... A cobwebb is a folded back dipole. It has LESS gain
then a normal straight dipole.

The ham which pointed me in the

Not really. I've already about covered it in my other post. If you stick with wire antennas, coax fed dipoles or a tunerless ladder line system are the best. Ladder line all the way to a good tuner is the next best. It all goes downhill from there. MK

Really Reg! Nothing to be gained?

Reg is correct on one point, you can't get more than 100% efficiency. Unfortunately, there is more to consider than just impedance and efficiency.

Let's first imagine that we point Reg's one 1/4 wave radial directly down. We have a classic 1/2 wave dipole. Works very well, presuming the feed is adequately balanced.

Now let's point Reg's one radial horizontal. We now have a bent or V dipole. We certainly don't have a vertical monopole (in the strictest sense of the definition). We still need to adequately balance the feed, something that is unnecessary if we have a reasonable number of radials. Second, we don't have an omnidirectional radiation pattern. We would if we have a reasonable number of radials. With a 1/4 wave vertical antenna, the radials serve several purposes that the mathematicians obviously overlook.

At that point, a vertically mounted dipole does the job.

I know

Yeah, I'll have a guess - a 1/4-wave vertical with a 1/4-wave radial, top or bottom, at 90 degrees has for practical purposes the same radiation pattern as 1/2-wave dipole sloping at an angle of 45 degrees.

Furthermore, its feedpoint impedance will be much nearer to a non-reactive 50 ohms than the ordinary 72-ohm straight dipole.

That's probably a model name rather than a manufacturer. I just checked my listing of 1920s radios and can't find anything like that. I have the 3 volume set of Alan Douglas' books on Radio Manufacturers of the 1920s, and if you can come up with a manufacturer's name, I can give you details. There might be a paper label on the bottom, back or inside of the cabinet that lists the manufacturer.

For Sale Homebrew 2 tube 811A amp. 80/40/20/15 meters puts out at least 400 watts or more on all bands. Runs off 110vac. Size is 14" wide, 11" deep, and 9.5" high. Has plate current meter, Fil on/off, HV on/off. with HV off it bypasses the amp. For QRP'ers it will put about 50+ watts with 5 watts drive. Is not built for 10 meters, 80-15 ONLY. Weighs 40 lbs, very well built. Prefer pickup if possible, may be able to ship or meet an hour or so away. $195
Thanks Tim

In the Morgan E. McMahons' "Radio Collectors Guide" there is a listing of a Voisometer Manufacturing Co. That is about as close a manufacturer as I can find. The only information I have on it is : built in 1923 and the 2 models were sold for $55.00 and $75.00, no other information on the sets.

Good luck!
Joe

Hi,

I have a Kenwood AT-120 antenna tuner for sale. It is in great shape.
It will handle 150 watts and is small enough to put in a car. This is
not an automatic tuner. You need to tune it for the best match.

I could send a jpeg pic if for those that are seriously interested.

$65.00 plus shipping.

Thanks,

Doug W3IIY

Hi,

I recently bought this filter and it turns out it is not the correct
filter for my rig. So, it is up for sale.
The filter measures about 1/2" x 1 3/4" x 7/8". This is the type that
would get soldered in place.

Asking $50.00 plus shipping.

Thank you,

Doug W3IIY

|Many articles on the G5RV show it being used with the feeders strapped
|together and tuned against ground on 160m. This of course is ALL feeder
|radiation, and none off the top, but its not a G5RV anymore, its a
|top-loaded Marconi vertical!

Actually, one of those articles is the original Varney paper.

(http://users.triconet.org/wesandlinda/g5rv.pdf)

So, by the popular criteria that the antenna described by Varney is a "G5RV",
this configuration *is* a "G5RV" too, although Varney described it as you do.

Actually, Varney's claim to fame is the *magic* 102 foot length. As I have
already claimed in a much earlier post, dipoles 102' in length are "G5RV"s,
balanced(?) line, end-fed wires are "Zepps", off-center-fed dipoles are
"Windoms", dipoles with the ends lower than the center are "Inverted-Vee"s and
all other dipoles are "N7WS"s.

it was my understanding it was composed of a lot of thin coax wound
into the lower section of the antenna.
But I may be wrong on that. But it's still an inferior antenna no
matter how they made it. It's been carefully compared to other brands
of verticals and lost out. Assuming each type had the same number of
radials under them, which I'm sure they did, if the GAP loses against
other same size verticals, it must have some excess loss somewhere.
I've never heard of one doing that well on 80m. The butternut did
quite a bit better. I'm pretty sure it was W8JI who did this
comparison. I think others have too. There may be something in deja
google...A friend of mine had one and it was near useless mounted in a
manner that they suggest. Someone gave it to him free for that reason.
The first owner couldn't get decent results out of it either.I think
the friend of mine ended up pawning it off on someone else...:/
Myself, I'm not crazy about any of the multiband verticals compared to
a full size monoband vertical. The butternut HF2V is pretty good for
80/40, but I made my own version for peanuts compared to what they
charge. MK

Check out this great, actual comparison by Mr. Banz. Helped me decide that
with no space for height and no radials, the GAP Titan DX was the way to go.
I still love it.

Source record: 45139

I may have. It's an older Phelps Dodge unit that's the same as the RF Systems 526, a 6 cavity high power base station duplexer that sells for $1500.

I'm not experiencing any desense or mixing at all. Part of this could be luck. Also, the MaxTrac radios being used are fairly well tuned and able to withstand an awful lot of overload off frequency.

I agree that the fancy equipment may only elicit a few tenths of a dB. Right now I'm getting about 35 dB per section for over 100 dB of total isolation, which isn't too shabby. I am using good foil+braid short RG-58 jumpers from the duplexer's N connectors to the radio's mini-UHF connectors, and the coax from the repeater out to the antenna is 1/2 inch plus 7/8 inch hard line coax. The building is all metal, and the repeater equipment is located in an all steel enclosure, however it is NOT gasketed and there are two 4 inch holes in it for the fans (with grills).

Just last night I won an eBay auction for a Motorola (made by Celwave) UHF 4-cavity preselector that I can put in the line between the duplexer and receiver if I find the need for additional selectivity. I think the duplexer is probably working properly at this time, it's just that I wasn't expecting any significant signal to show up on the spectrum analyzer multiple times at several dozen megahertz away from the tuned frequency.

Thanks to all for this useful discussion.

4543. Differences between sb-200 and sb-201 ??

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-05 06:14:48 UTC
From: joel <joel@cyberbest.com>
Message-ID: <Ohbr8.2347$fC.993837161@twister1.starband.net>
Source record: 45048

Hi all,
I happened to find a well beat up SB-201 that obviously needs a lot of work. I was wondering what the difference between the SB-200 and SB201 as they seem the same. This one has one burnt up parasitic plate resister (at least). and some broken wires and components. I'm wondering if it's worth salvaging. I figure by the time I buy two new 572's and maybe the harbach mods, I have about as much money in it as I could buy one already working. Anyway, just looking for opinions.

Thanks,
Joe (AG4QC)

4544. FS: Uniden UHF Repeater

Source record: 45060

I had a guy wanting to buy this but, he backed out of the deal,
so here goes again.

For Sale: Uniden Force table top repeater 450-470mhz. Built in duplexer.
My friend is a tech at a radio
shop and he said this can dip down into the ham band.

The unit was taken out of service and replaced with a new
MTR2000 repeater. The unit is in
tip top condition and the only thing that this needs is
crystals.

The model number is ARU251K. Since Uniden no longer
services these units, they've turned
it over to Relm. I contacted them and they sent me a file
with complete schematics and alignment
specs.

Price: $200 plus shipping COD or PrePay from Las Vegas.

>
> http://www.qsl.net/aa3rl/titandtl.html

There are lots of holes in that test though. For one thing, many of
the "reference" antennas are kind of on the strange side. Lets start
with the 40 meter test which means the most of the bands involved. He
uses a 3/8 wave whip elevated at 5 ft off the ground, with two 20 ft
radials. Now, being these radials are not resonant, and they are
elevated, they are next to useless as far as cutting ground losses. So
he's comparing a homemade fairly lame antenna against a storebought
fairly lame antenna. Now, I'm missing his result table for 40m, but he
states a -7.6 db decrease in average reports against the 3/8 wave
antenna. Now being the 3/8 wave at 5 ft with two fairly useless 20 ft
radials is not a barnburner by any means, it's kind of disturbing that
the gap LOST by 7.6 db. Also I have to wonder how he measured the
differences in DB. Step attenuator?, S meter? , etc. He doesn't say. I
have to presume an attenuator being he can specify the loss in DB. So
anyway, for the poor person running the GAP, he would need about 600w
of power amp to equal the ERP of the person running the fairly lame
3/8 wave. From what I can tell, the only band that the GAP didn't get
beat up on was 20m. And it was a tie. All the rest of the bands it
seems to have lost. Against low insufficiently radialed 3/8 wave
verticals. Now, I have no problem with anyone using a GAP if thats
what they want to use, but I'm curious to why you decided this antenna
was for you, when it got beat up on like a lost step child in this
"great actual comparison"? Inquiring minds wanna know... -11 db on
10m??? -7.8 on 15m, etc, etc ??? Good grief...I think they used the
wrong name. They forgot and left the "C" off the front end...I noticed
he didn't include 80m. Does the titan have 80m? Thats the band where
the testing will mean the most. I guess the thought of posting the
-?????? numbers for 80m was too scary to deal with...
Oh well, another day, another two dollars thirty two cents. MK

I'm also from the "old school" that when someone doesn't know when to shut
their smartassed mouth and ends up getting it shut for them, that they learn
a valuable lesson and chalk it up to experience, but it appears that you
come from the new breed of jerkoff punk that continues to mouth off and
deliberately provoke others into an argument so that they can call the cops
and try to have the guy arrested for knocking the living shit out of you..

I live in the San Francisco Bay Area. Zip me an e-mail and let me know when
your in the area, cuz i'd love to eyeball with you. I get up to W7 land
occasionally as well if you're in the Oregon/Washington area, but I wouldn't
trust you as far as I could throw you cuz trash like you have no integrity.

Not to mention that you don't know what in the hell you're talking about..

Please don't bother to respond, cuz I won't..

I hear where you're coming from, and even though the area is full of
potheads, this mentality is not at all prevalent. I worked there for five
years and *never* even one time had a client call my honesty into question..

And I hate to disagree with you, but in the twenty four years that i've
worked in this type of capacity in the San Francisco Bay Area and elsewhere,
I can't count the times on one hand that any coworkers have been accused of
stealing from a client..

> I hitchhiked the whole country in those days...I wouldn't dare hit a

> society. Its a great memory, tho.

The only time that I would pick up a hitchhiker would be if he was carrying
a gas can, and even then I would exercise extreme caution. If I use bad
judgement and get a knife or gun pulled on me, then we'll see how long it
takes him to hand it over or throw it out the window after I floor the gas
pedal and threaten to run into a concrete overpass abutment. If i'm gonna
die anyway i've got absolutely nothing to lose, but he does..

The baby boomers aren't old enough for SS.
I come from the previous generation and just applied for SS and won't
receive it for some months yet. They had it the best of basically any
generation I've seen and they thought they had it the worst.

We have about another 8 years or so that they can still keep pumping money
into the stock market until the numbers drop significantly.

After them the next generation was the "X" generation, or lost generation, I
believe.
That was when we had the gas shortages (or was it still another generation
later...once you retire, you seem to lose track of time) we started to

recycle, move to cars that lasted and got good milage. Now we have huge SUVs and Trucks...actually they are selling more of those than cars and have been for at least three years.

The baby boomers were still in the time of "planned obsolescence". I had a Ford Mustang that actually rusted out by the time it was 6 months old. Pretty car...built like crap. The Ford company offered to stand behind it and pay half the cost of the repair...I could get it done for less than that at most autobody shops. Then the auto industry and unions couldn't understand why people started buying foreign.
>
I actually stayed with US cars until last fall when one of those imortal teenagers pulled out in front of my Transam with his invinciple SUV. I drove right through his door...The TAs wheels were big enough to put me over his frame. The only thing that saved his life was the massive door post on that GMC Jimmie. Shortened the TA up by about a foot and a half. Put the right front tire back into the firewall and there was no space left under the dash to get at the wiring because it drove the fire wall back so far. I wasn't even sore the next day. BTW, I only had time to leave about 12-15 feet of skid marks. I was punchy (and deaf) from the air bags for about half an hour.

The control head for the 2-meter rig was mounted on the dash. I stopped so quick, it layed down flat...Bent the metal right down to the plastic.

BTW, I had an FT101B and "thought" it had 6146s in it. Damn near got electrocuted off that rig due to a poor soldering job from the factory..

Were it me, I might try four folded dipoles made of half inch copper pipe.
Using the standard 90 ohm phasing/matching harness and mounting the antennas
as two pair on each side of the tower to get a pretty symetrical pattern.

One thing to remember is that unless the antenna is on top, the pattern
varies greatly with the spacing between the antenna and tower,.

If I had the fiberglass stick, I'd probably make/build a coaxial antenna and
insert it into the fiberglass stick. Use fiberglass supports, or other good
and strong insulating material as supports to keep the antenna from whipping
around if side mounted. The big top mounted commercial ones are massive and
must weigh close to 100#.

I've used the copper pipe, folded dipoles on 2-meters with good results.

If you elevate the feedpoint to at least 15 feet, four radials
will perform just as well or better than a ground mounted
vertical with 120 buried radials. This was the conclusion
of K8CFU who took hundreds of field strength measurements
from both configurations (Radcom, Technical Topics April 89).

Interesting. I had a 1998 Mustang for over three years + 60k miles and didn't have a single problem with it. The best car I ever had. If my company didn't insist on giving me a company car, I never would have sold it...

Hi Simon,

Congratulations to your licence!

When I came back to ham radio three years ago, I was in a similar situation. I have now tried a couple of verticals and a couple of multiband wire antennas. I first used a (no radials) Cushcraft R5, which performed reasonably well 20-10 m (their R7 and later R8 are similar designs for 40-10) when mounted high and in the clear. Not that well when mounted on the ground.

But the R5 could never beat my 135 ft flat top fed with 450 ohm ladder line and ATU! I have found the latter to be a surprisingly good antenna here, even though ground conditions and surrounding salt water should be good for a vertical.

I then moved to a Butternut HF2V vertical , trapless design for 80/40, using six 33 ft radials and mounted on at 25 ft above the surrounding ground. This antenna works beautfully on 40, where it is almost full size (32 ft hight) and also, surprisingly well, on 17 m!. Performance on 80 m is satisfactory, although the bandwidth is limited. I wholeheartedly recommend this antenna to anyone interested in 40/80 m dx. I now use it as a multiband antenna 80-15m (it gets a bit long for low angle radiation on 12 and 10 m) with an ATU at its bottom and additional radials.

BUT, again, I have recently tried another wire antenna, this time a horizontal loop , first 42 meters long, then 81 meters , fed with 50 ohm coax and with a low SWR on most bands, in need of a tuner on a few of them. This is my current favourite, a surprisingly good antenna not only for Europe but for DX as well. And silent, compared to my verticals, which in a city environment get very noisy, particularly in the summer months.

So, in summing my experience up: verticals are ok, provided you have good ground where you live, mount them high and (preferably) use radials. Good radials take a lot of space! And verticals are expensive and sometimes noisy.

Both the 135 ft ladder line fed flat top and the horizontal loop (called "Loop the Skywire" in the ARRL Handbook/ Antenna Book) are excellent multiband antennas, also for DX, inexpensive, although you need to make a (smaller) investment in a tuner.

I have no experience of the G5RV but from what I hear and read,a flattop with ladder line normally performs better.

Good luck!

73ï¿½s / Per / SM0WRA

Spring is here. This means we will be trucking, RVn, or driving to hamfests, ham conventions and field day. Be ready with a sharp looking Ham Call Plate on the front or a window sign across the back. Inexpensive and, as always, satisfaction guaranteed.

Makes a great gift, too. Order on our web site: www.ParisMtnSignCo.com.

Please if you have questions or want to make a trade contact me off list at my e-mail address.
gundoc@iglou.com Some of these lists are not swap lists and only tolerate my post because it is only once a week. To the group owners thank you for letting me continue to post to the group. I have had requests to put spaces between
the radios on the list so I am going to try this on this list. Let me know what you think.
Dean

GE Portables

GE MPA VHF 146-162 full system keypad. Radio is as new and is almost perfect. The only flaw is the grip tape under the PTT button is peeling at the edges. Otherwise perfect. The next feature is, The radio is Key pad programmable. 16 channel scan and front face programmable. Has a like new battery and a good rapid charger. Also a belt clip. $500.00

GE MPA VHF Select 157 - 174 split. Nice radio 9 condition with battery and standard charger. I have it programmed down to 154 MHz with no trouble but will go no lower. $200.00

GE MPA UHF Scan 440 - 470 192 channel scan. Radio works great. A little paint wear on the edges but I have seen worse. With charger and battery. $225.00

GE MPD UHF select model 440-460. 48 channel alpha-Numeric display. programmed on the 440 ham band and works on the local repeaters and GMRS. With Battery and standard charger. Nice 8 - 8.5 radio. $100.00 Also have 1 in about a 7 condition $90.00

GE MPD select model 470.- 488 MHz. 48 channel Alpha-Numeric display. With battery and standard charger. 7-7.5 $90.00

GE MPD Scan UHF 440- 460. 48 channel Alpha-Numeric display. Also programmed on the hamband for testing. Works on the local repeaters and GMRS. with battery and standard charger. $125.00

GE MPD scan VHF 150.8 174. 48 channel Alpha-Numeric display. These look good and come with a battery and standard charger. 135.00 each.

MPD Voice Guard VHF system model with full keypad. 48 channel alpha display. with battery and standard charger. $140.00

GE PCS EDACS 800 MHZ Scan. This radio looks good and is an 8 condition. Has a good battery and charger. This will do conventional or EDACS. $250.00

GE PCS UHF 8 channel. I have this radio on the uhf ham band for testing and it works the local repeaters. with battery and charger. $95.00

GE MPS VHF Like new 10 channel. With new battery, new antenna, and a standard charger. $65.00

GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00

GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $225.00 all 3 radios.

GE Mobiles

GE Phoenix SX VHF 16 channel with dual priority scan. Grey case with mic, speaker, and power cord. Tested working. $75.00 each. I have 2 complete.

GE Phoenix SX VHF 128 channel scan. No accessories. Has all 8 proms. $100.00

GE MVS UHF 16 channel scan. With Mic, Bracket, and power cord. $125.00

GE Mastr exec II VHF 75 watt mobile complete with accessories. $60.00 each

GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each

GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00

.GE Ranger VHF 150.-162 100 watt mobile. Complete with cable, Mic, speaker, and S550 control head. This is a great public safety mobile or can be tuned to the 2 meter ham band. $175.00

GE S990 head. Looks new but I have not had time to test this yet. $75.00

GE S550 head 16 channel looks good but not tested. $35.00

GE Mobile Vehicle Adapter For MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com) With mic, speaker, and power cable. $100.00

GE Accessories

Mastr II control cable. $8.00 each

Mastr II head for mobile repeater operation. $5.00

Mastr II Mic. $5.00

Mastr II 8 channel tone boards. $5.00

Mobile Repeater cable for Mastr II. $10.00

Mobile Repeater cable for Delta or Ranger. $30.00. I have seen programming cables made from these.

GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2. If you

buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.

GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each. I have 2 sets of EC/5C UHF icoms left and I bought 7 sets of 2C UHF Icoms = $30.00 per set. I have 5 sets of these left now.

GE Delta cables. These are the downloading type used with the S820 heads. $40.00 each

Delta mounting plates. $10.00 each

Ranger mounting plate. $15.00

GE S-550 / 500 and others mounting brackets. $5.00 each

GE MPA, MPD, MTL public safety mic. $35.00 each

GE MPA, MPD, MTL standard Speaker mic. $25.00

GE PCS Universal Rapid charger. $35.00 each

GE MPA standard chargers. $20.00 each

GE MPA Rapid chargers. $30.00 each

GE MPI desk charger with wall transformer. $10.00

GE MPI Rack charger, 8 position. 25.00

GE MPI Mobile battery charger, Rare. $20.00

GE Battery discharger analyzer. For MPA, MPD batteries. Attaches to a rapid rack charger with a DB 15 cable and uses a MPD body to attach a battery to. Has LED readout in display area of MPD body to tell discharge rate. Another rare GE goodie. $45.00

GE shoulder strap like new, attaches where belt clip is. $15.00

GE Belt clips. $10.00 each

GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card and power supply / speaker. $300.00

Other Radios and Accessories

Motorola Saber III VHF 146-174 split. 120 channel Alpha-Numeric display with secure - net module. (no out of country sales) des I think. I have been using this all week and talking on the ham band to test this radio. Battery has lasted all week during drive time so it seems good. With rapid charger and big battery. $525.00 or trade for a VHF MRK II

Icom 3200 a Dual band ham radio. Has box and manual but no mounting bracket. Has tone squelch board installed. $225.00

Yaesu FT-50 dual band portable. In the box with all papers. Not new but most people could not tell it from new. 5 Watt battery. $190.00

Icom IC 24-at Dual band Portable. In good shape, Display has no scratches and only 1 small patch of the paint is peeled off of the back of this radio. With manual and wall charger. $175.00

Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland. $75.00

Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00

Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00

Motorola P200 VHF 136. - 150.8 high power. New battery and charger. 2 channel but can be made into a 6 channel easily. This would be a great ham radio. $115.00

Motorola Mitrek VHF high 110 watt drawer only. $50.00

Motorola Adapter for MX radios for the 1801 suitcase programmer. A and B prom. $175.00

Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all

Motorola UHF Convert-a-com Amp. 5 in 40 watts out. $45.00

EF Johnson 242-8600, 800 MHz LTR I have 4 of these. $25.00 each

EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00

Kenwood TK 940, 800 MHz dash mount radio. $100.00

Uniden SMS 825 ts, 800 MHz Dash mount radio. $75.00

MRC 100 Repeater controller in rack mount. $100.00

Voter from IMTS phone system. 2 rec and 2 tx cards. $40.00

Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00

Antenna Specialists on glass 440 antenna. New old stock. $22.00

Antenna Specialists on glass 220 antenna. New old stock. $22.00

Consignment section

This area is for a few friends who like those other radios you know

"Motorola" They are good people and I will pass along any trades you may wish to make.

Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete. $425.00

Motorola Maratrac VHF 100 watt 16 channel head, Never mounted in a vehicle.$375.00

Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each

Motorola HT1000 Intrinsically safe, Re-cased looks new. 16 channel scan with charger. $425.00

Motorola P200 UHF high power. 6 channel. $150.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, anything you have extra. MPA or MPD portables what do you have and what do you want for them?
Johnson scorpion program cable. PSX200 UHF mobiles.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. Hi ,

I have recently found a dual mic cable designed to be used with the Standard 5718DA or 5900 series radio's .
I used it with a 5718DA mobile I used to own and that I needed to interface a 1200 baud TNC .

I'm in need of Kenwood batteries for my TH-78a , these batteries are the PB-13 , 14 and 18 series NiCad preferred .

I'll trade for good batteries or will sell the cable for $40.00 plus shipping .

>
> My main interest within the hobby is contesting - my G5RV doesn't really cut
> the cake when it comes to contesting!

Well Simon, it would depend on which contests you are interested in.
If you are interested in the 80m contests run by the RSGB which rely
on local contacts, a vertical would always be a poor choice. In any
case, there is no such thing as a free lunch and all ground-mounted
verticals need radials to work effectively (contrary to what others
have claimed here). You might consider replacing your G5RV with a
doublet, this will tend to outperform the G5RV.

To do better in contests with a simple antenna system, I would suggest
that you need to concentrate on just one band. Basically, you are most
unlikely to do very well in any contest with such a simple antenna
system unless the other contestants are using similar systems. That
should not stop you having lots of fun however and you can certainly
improve your operating skills.

For more advice on contesting, I would suggest that you join the UK
contest reflector at QTH.Net.

Mark:

I'm glad you took the time to read the article. After I read it, I emailed Mike Banz with some questions since I am an investment consultant and by no means an antenna engineer. He makes no "bones" about the compromise. In fact, below is a large portion of the text of his return email.

"I believe that the Titan is a reasonable compromise for a multiband vertical antenna where NO ground radials are possible, and no-tune performance on multiple bands is required. From my tests you have observed that it's performance on 20 meters is equal to that of a monobander. On 15 and 40 meters it is slightly compromised. On 10 meters it is poor, and on 80 meters useless.

If you want to work 10 meters, you would want to supplement the Titan with a small home brew monobander. However, putting myself in your shoes, i.e. if I wanted to work 10, 15, and 20 meters, but nothing higher, I would probably erect three simple free standing monobanders with elevated counterpoises. These would out perform ANY commercial antenna, and could probably be constructed for under $75 total. The biggest issue might be that they would be much less visible than the Titan. I had my Titan next to monobanders for 40, 15, and 10 meters, and it stuck out like a sore thumb, whereas the simple monobanders are so thin as to be practically invisible."

Before I left the hobby back in the '80s I had a small beam, then after moving here with CC&Rs, I had to use what I could by "hiding" dipoles that didn't work, and finally by taking a chance with a ground mounted 4-BTV. After returning to the hobby years later, and living in the same location, I knew that only a vertical with no radials was possible. That was a bunch of money, so after all the research I could find, I spent it on the GAP. I found no other reasonably thought out work about any other vertical antenna, and the consensus of the news groups was to move to where I could have an antenna farm. I was willing to do so, but nobody wanted to pitch in and help me afford the move.

For all the compromises, at least I am on the bands again, and can ragchew when I want, and in six months of working, have worked 182 countries on five bands with 100 watts. I guess the key here is that even with CC&Rs, very small space, and all the compromises, I am back on the air, and again enjoying the hobby.

Thanks again for the comments.

Hi Mark,

Well, for one, the difference between the oft repeated claim that Gap
>use intentional resistance to get a better match
and the equally, repeatedly expressed
>composed of a lot of thin coax
do not amount to the same thing.

For two, I have (as would many) far more coax going to the antenna than is found within it (which is not "thin" in any sense and not coax either, but then there is the eye of the beholder and such). I can imagine some may want to argue how lossy coax may be, but even at VHF less than 10 feet makes for a poor example and a poorer argument, and VHF is not even in the mix.

For three, you do justifiably point out that if compared to a simpler antenna that outperforms it, that this constitutes loss. Not Ohmic, unless some better data is provided in the place of repeated assertions that are untested. There is a far simpler explanation, a larger radiator, in relation to wavelength, tends to develop lobes of radiation that serve no useful purpose. Hence the complaint observed in another sidethread of poor 10M performance (which does not occur with my Gap).

For four, I have the Gap Eagle. It is not generally discussed here as most interested parties are trying to get onto 80M. I will allow that the low bands of any Gap design are inadequate to the task, but they still offer a match as promised AND if we were to strip away all the gee-gaws and match the traditional way, it would still be a poor performer on those same bands. Hence, if one is limited in choices, then the availability of a more suitable match is a boon (not something that worries me however).

For five, I have followed the modest requirement of elevating the Gap as specified. There is no issue of radials, aside from those elements serving their purpose to some degree and I have compared to many stock designs to find that sometimes they are better and sometimes the Gap is better. At times the only explanation I would offer would be the angle of launch or arrival - this is entirely speculative, but supported by ad-hoc observations and using propagation modelers to distinguish the operational differences.

For six. It has withstood some good windstorms unguyed. It always plays (if better on some bands than others). I have never had to service it, but I have inspected it on occasion and found nothing out of place (except for one cracked bead at the choke, wind damage of the cable slapping against the tube - as this was at the inspection level, a simple tape job resolved that easily).

Would I buy another? I didn't buy the first one, it was a gift of my buddy when he moved up to a tower and Log Periodic. However, to answer the question honestly; no, I wouldn't buy one. A simple pole driven through a tuner does the job too (better/poorer/indifferently).

to see this book.

Great for Engineers, technicians, experimenters, hobbyist, and students

This great reverence book contains over 3600 widely sought after electronic
circuit designs from thousands of magazines, books, reports, and application
notes.Each schematic is complete with values of all parts ans performance
details. This 7 pound book has an in- depth index with over 10,000 entries.
This book is divided into 131 sections for all kinds of circuit drawings
such as alarms, analog to didgital covertors, battery charging, comparators,
filters,frequency counters, gates, infrared, medical,photography, telephone,
transmitters/receivers, power supllies, and a whole lot more.

Over 1000 pages Copyright 1974 Hard cover in good condition. Jacket has some

Just finished using the Ameritron 811H quite a bit over the WPX weekend. Not a serious effort, mainly for fun. Fired up the amp and radio a few days later and the amp does not seem to want to key up. I did not notice anything wrong with it during the contest. When I finished with the contest, I powered everything down and that is where it sat for a few days.

I am using a TS-850 as exciter. The radio seems to key up fine and I see it move the needle on the wattmeter to 60 watts or so which is where the power is set. The 811H lites up, tubes glow and have HV on them according to the meter. Just no relay kicking in when I key up the 850. I verified the relay cabling between the 850 and amp is connected as it has been for quite some time. Any thoughts on where to start looking?

Excellent stuff, thanks. Interestingly, several people have pointed out
that a doublet may work as well.

I think I'll have a go at making one - thanks for the info. By the way,
your callsign looks very familiar - perhaps we've worked in a contest
already!

Thanks for your response (and thanks to everyone else, keep 'em coming!)

Richard, I'm mainly interested in the large(r) contests - mainly CQWW and CQ WPX. I like these ones because they either have a 'rookie' category or a 'single element' category or similar!

From the replies I've been receiving, I've learned that verticals tend to work reasonably well on the lower bands, for DX contacts (although they're less reliable than a dipole for making inter-continental contacts).

I think I may have a go at making a doublet or perhaps even an inverted V, as long as I can get permission from parents. :)

Luckily, my dad is a ham (although now inactive, mainly because I've pinched most of his equipment!) - he's licenced as G4CVS, so I think getting permission shouldn't be too tricky.

By the way, the garden is about 40 - 45ft in length, so it's not too bad. But on the other hands, it's quite short too :)

73, thanks for the nice replies folks.

On my TS450S / AL811-H setup I had to enable "linear keying" through the menus in the TS450S. It may be somehow this got disable in the TS850S inadvertently. Anyway I would check that in the rig and one can also monitor that line with an ohm meter while keying the rig to verify it switches states...

Just a thought... 73 / DX

First, disconnect the RCA plug from the amp keying connection and connect a RCA cable (like a standard audio cable M-M). With the amp on and in operate mode, short the contacts on the open end of the cable. The amp shoud key up (relay will energize, but no RF output) if the amp is working properly.

If the amp passes this test, then pull the amp cable from the TS-850. Check the cable by "ohming out" the individual wires at both ends of the cable.

If the cable tests Ok, then look at the amp DIN connector on the rig. The DIN connector sometimes gets flakey on this rig, plugging the cable in and out a couple of times usually cures it. If not, try squeezing the pins a little bit closer together so that it plugs into the connector more snugly. (I had an TS-850 with this problem, and still have a TS-790 that needs to have the amp DIN plug "tweaked" from time to time... :>)

Thats the bottom line. If you are making qso's, it's better than
nothing.
Again, I have no problem with anyone using one of these. I guess my
gripe is their theory of no radial operation, etc. They shoot
themselves in their own feet by stating that over and over again. If
everyone ran radials with the gaps, they would probably have less
complaints. I guess my main point is, if you are "really" serious
about a high performance vertical, there are better routes to go.
Mostly homebrew. Of course, most high performance vertical systems
don't do multi-band very well. The butternuts are "probably" about the
best as far as a multiband antenna, but they make no bones about
radials being required for good operation. MK

When I connect a solid state box like a Kenwood to an Amp I use some sort of switching device i.e a transistor between the Tcvr and the Amplifier Relay coil. I suspect that the current drawn by the relay is more than the tcvr could handle. If I recall correctly the Ameritron keys via a ground connection to the relay coil. See if you can do this manually. If so looks like the Kenwood. Of course at this point you will need some fancy optical equipment, a pair of fine tweezers, a Japanese to English translator, an anti-stat booth and soldering/desoldering station to remove and replace the failed component. Just kidding I'm way too old and way too stuck in my ways to change.

Mainly just the lack of ten meter coverage in the 201. They are about
the same otherwise. The parasitic chokes would be easy to fix or make.
Dunno, I think you would do ok by fixing one up. If you buy new power
supply parts and tubes, it will most likely run for a long time
without problems. They are pretty good old amps. Will do a solid 600w+
out with decent tubes. I've still got an old beater SB-200 I've been
thinking about doing the same thing on. It would make me a good
portable amp that runs on 117v. Most of the places I go have power
hookups. But you do have a point, you can buy a working one fairly
cheap. BUT, you may end up redoing the power supply, etc anyway
further down the road as it may be half wore out when you buy it. Just
depends... Some are still like new nearly if they haven't been used
much. The caps run real hot on those because the bleeders run real
hot, and they stuck them right next to the caps. "tip" If you fix one
up, add a little extra cooling, and route a bit of air over the power
supply parts. They will last much longer. MK

Source record: 45083

Pulled the RCA plug off the back of the amp and shorted as you
indicated. No relay action. Amp was in the operate mode. Looks like
there might be a problem with the relay circuit as my reading of the
schematic has +12vdc on one end of the relay coil and I just grounded
the other.

My copy of the schematic in the AL-811H manual is pretty fuzzy in some
places. If I am reading correctly, it looks like +12v comes off
bridge rectifier D1, through the Opr/Stdby switch, through diode D3
which is an LED for XMIT in parallel with the 33 ohm 1/4 watt resistor
and then to the relay coil. Diode D2, a 1N1007 is across the relay
coil in reverse bias.

So, using some logic, a D2 failure, the 1N1007 across the relay coil,
could be the problem if it failed short. I would think a diode would
fail open though which would not result in a short across the relay
coil. Failure of the XMIT LED or the 33 ohm in parallel is an option,
though probably not likely. Bad contacts on the stby/opr switch could
be the problem, again, I would not think likely. Failure of the
bridge rectifier could also be the culprit. But, this powers the
meter lamps and they light up.

So, the most likely culprit seems to be the relay coil.

Anyone see anything I missed or have a different opinion or
corrections to my schematic reading? Thanks for the replies thus far,
they have been very helpful.

TIA

Tim, KK9T

Time for a sanity check. Simon's original post was asking for better
contest antennas not hiding antennas or dealing with CC&R's. The GAP
antennas are a lousy choice - contesters joke about them.

Simon, there have been many opinions on this subject but not many from
serious contesters who continually strive to improve their stations/signal.
Here are a few ideas and resources for improving your contest antennas.

First, take the time to study what other contesters use for antennas. They
have spent a lot of time and effort making their stations as competitive as
possible. There is a World HF Contest Station Database that lists station
descriptions at:

http://www.pvrc.org/WCSD/WCSDsearch.htm

several other big contest and DX stations are featured at:

www.qsl.net/dj7ik/bigguns.htm

Some of these stations have HUGE amounts of antenna hardware as well as
a carefully selected location for best HF performance. I'm not trying to
discourage you, but it is important to understand that contesting with a
G5RV or vertical will get frustrating when competing against stations with
stacked Yagis on tall towers running full power. On the bright side, most

top ranking contest operators started off with small stations and simple antennas when they were younger. They made the most out of their smaller setups by learning and practicing good operating skills, learning about propagation, etc. This hard-earned experience really pays off later when joining multi-op teams or when they can afford their own house/station (with much bigger antennas).

If you look through the station descriptions, you will notice verticals (and related antennas) are preferred on 160m, somewhat on 80m and somewhat less on 40m. Antennas for 20m, 15m and 10m, are dominated by horizontal types (mostly Yagis) at least 1/2 wavelength high with 1 wavelength generally being better.

As someone has previously suggested, check out:

http://www.cebik.com/radio.html

W4RNL's site contains a great amount of information on several types of antennas you might consider.

Simple wire dipoles and loops are fair performers but contesters prefer antennas with more gain (Yagis, quads, phased arrays, etc.). Higher gain antennas are usually considered much more costly, but you can build gain antennas at reasonable cost using wire, rope and a few trees or other supports (hopefully aimed in a prefered direction). Other options might include two element Yagis or Moxon rectangles for the 10m or 15m band - they are relatively small and can be homebrewed at relatively small expense.

Try talking to other contesters and DXers in your area. They might know of an old tribander not being used (or a bigger station to operate). When I was 17, a local offered a 3 element tribander at a low price which was quickly placed on a 6 meter high pole and rotated using rope tied to one end of the boom. It really boosted the contest scores!

Here are some of the antennas I would be investigating in your situation - I would try to erect multiple antennas even if they are simple dipoles:

160m: inverted-L
80m: inverted-L (DX) inverted-vee/dipole (local)
40m: wire vertical/inverted-L (DX) inverted-vee/dipole (local)
20m: tribander (used), wire Yagi or dipole
15m: tribander (used) or homebrew 2 element Yagi/Moxon rectangle
10m: tribander (used) or homebrew 2 element Yagi/Moxon rectangle

The MFJ-1792 or Butternut HF-2V are decent 40/80m verticals if you intend to buy. The verticals will require several ground radials for best performance (unless you can elevate the bases a good amount).

Also, for lots of contest information look at http://www.contesting.com

There is information about several mailing lists at this site. I'd suggest the cq-contest, TowerTalk, WWYC (more info below), and 3830 lists for contest and antenna related discussions. There are many

contesters on these mailing lists that would be willing to offer their advice. You can look through the archives at http://lists.contesting.com/ or search the list archives from main page at http://www.contesting.com

Finally, I recommend checking into the World Wide Young Contesters (WWYC) if you haven't already. Their web site is http://wwyc.webbg.com (I get an error running Netscape, but it is OK using IE).

Good luck & 73,

Steve

The antenna you seem to be describing appears to be a dipole with an
included angle of ~90 degrees, which isn't the sane animal as a
vertical monopole working against ground or its equivalent.

<big snip of interesting posting about antennas>

>Thanks for the opportunity for the debate.....

Thanks also for an interesting discussion - it seems that the more one finds out about antennas, the more one realises how much more there is to know!

But you have to start somewhere, and I hope that the original poster, and any other newcomers, have been given some pointers to a fascinating subject, and also some pointers to antenna basics that might spare considerable dissatisfaction with an expensive commercial antenna.

I like your idea of plotting the positions of objects that could affect the radiation pattern on a great-circle map. For a horizontal antenna the same could be done bearing in mind the predicted major lobes, minor lobes, and (perhaps more importantly) where the nulls could be expected - and then trying to confirm this with actual (targetted) contacts.

Your contest advice, is, I suspect, hard-earned and a highly relevant!

It's good that you finally showed up to "save the day"... This tread could
have gotten off the subject, and certainly no other threads do....

If you were interested in answering his question instead of looking for
someone to bitch at, you could have answered earlier or even answered him
directly.

Just in case you don't know how to do that, you would first highlight his
original message, then select, "reply to sender". But since you wanted to
be sure that we could see all your knowledge, you were right to select
"reply to group".

If you paid attention you would have noticed that he did ask for comments
about the GAP.

Sounds like you got it pretty well reasoned out. You might want to try isolating the relay and applying direct voltage to it to see if it closes. If it doesn't, there's your culprit. If it does, then start tracing the circuit backwards from the relay with a VOM until you find the failed component (most likely one of the diodes).

Good luck and 73,

Dan

I've never stripped one apart. I could see the thin coax having a good
bit of loss on the higher bands, but you would think it wouldn't
amount to much on 80/40 meters. I wonder how long this "supposed" coax
section is? And how thin?
>

> with my Gap).

Sure, even the butternut has this problem to a degree on 10m. "3/4
wave". But they did design them to use only a 1/4 section on 15m to
get around this problem a bit. But my comparions apply mainly to the
low bands. 80/40, etc.
To my way of thinking, if two antennas are appx the same height in WL
for a certain band, and both have equal radial screens under them, and
one loses out in a comparion test, how can the loss be anything other
than ohmic? Both antennas are short for the low frequencies.
>

I could see that happening if the antennas were slightly different
heights, but again on the low bands, I would think the launch angles
would be about the same.
>

> a simple tape job resolved that easily).

Well, I guess thats good. But I can say the same thing about all the
antennas I make also. I used a homebrew self supporting 32 ft
vertical. I made it thin and flexible. There were times with strong
winds that the radiator was blowing sideways, but it always propped
back up straight when the storm blew through.
I still have the antenna, but haven't use it in a while. I took it
down because I was paranoid of lightning hits to a 68 ft tall vertical
lightning rod.. That was during a summer of daily lightning storms.
>
A simple pole
> driven through a tuner does the job too (better/poorer/indifferently).

Agreed. But I think using full size mono band verticals the best route
for anyone that wants to get serious about a vertical. For 40-10 use
for someone that can't use radials at all, there is no doubt in my
mind a R-7 or similar antenna elevated about 10-20 feet will smoke
anything else out there with no radials unless it's a full 1/4 wave
over real good ground. I've seen it happen over and over. I've also
used them at field days quite a few times. They are actually pretty
decent antennas and don't have near the TOA problems on the high bands
that a multibander acting as a 3/4 will. When I was running the full
size GP on 40m, another guy here in town used an R-7 at about that
height."15-20 ft" He did quite well for what he had to VK land. He
was a tad down from the full size antenna, but not a whole lot. He
outdid some of the stateside guys running lower dipoles, etc. I do
have to say we were both running a KW...But then again, we were both
loud in the desired target of VK land. Gotta do what you have to
do...I was usually over S9 in VK land with a KW. Didn't want them to
have to strain their ears..:/ On the higher bands, I almost always use
full size 1/2 waves or 5/8's GP's if I use a vertical at all. My 40gp
doubled as a 5/8 on 17m. Depends on the band...I prefer a high dipole
on 20m, but I prefer a good 5/8 GP on 10m. Better local coverage. MK

You do not need to play with the radio's 'tone' and 'shift' settings for AFSK, these are used for FSK only. If you are using the AirMail v3 software you really don't need to play with much of anything on the radio, most everything is easily set up from the 'Options' menu in the AirMail software.

Also, I assume that you realize that when using a PTC-IIe you will need a second serial port on your PC if you want to have the AirMail software automatically set the operating frequency for you.

On the plus side, once you get everything set up I believe you will find that the 706 and the PTC-IIe make a great combination.

4597. New Hallicrafters SX-88 Bezels

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-06 03:10:03 UTC
From: gharmon@idworld.net
Message-ID: <3cae66f1.256928884@news.idworld.net>
Source record: 45002

Good evening all. Looks like the SX-88 bezel project is on track and on schedule. Initial price estimates are listed below and include priority shipping to U.S. addresses.

30+ units = $190 each
20-29 units = $210 each
10-19 units = $285 each
6-9 units = $490 each

As mentioned before the final product will be black anodized. The fabricator will create one unit as a sample and provide it to verify fitting to the panel, glass fitting and all the other points to be considered while determining if the model is acceptable from all sides and fits. The fabricator said there will be a tiny radius at the inside point of the bezel openings. When I get pictures of the sample unit I will provide digital photos. I'll post them on a web site for all to review.

If you have any additional questions please let me know. I will be glad to add your name to the list of interested parties.

73, gary

4598. Yaesu FT-101 and Fox-Tango mods

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-06 04:01:07 UTC
From: AB Brown <abbrown@nospammail.com>
Message-ID: <a8luko$48r$1@slb0.atl.mindspring.net>
Source record: 45003
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Just received the Fox-Tango Newletters library. I am interested in performing several of the mods listed, starting with the doubly balanced mixer in the receiver, using the MC1496. Although no circuit board patterns are disclosed in ANY of the volumes, I believe I have enough information from the schematics and parts layouts to construct the mixer unit. Does anyone have experience in fabricating their own mixer boards and could provide suggestions? How much difference does this mod make in the receiver, which seems poor on 10/15 meters at present? Several experimenters mention IMD problems due to the IC used. Any better substitutions?

Any other mod suggestions would be appreciated.

Thanks,
AB

Please see my Heathkit Mohican Portable Receiver, Model GC-1A, up for
auction on e-Bay. This receiver is in exceptionally nice condition having
been stored in a closet for most of its life. It works great and has both
the AC and DC(for C Batteries) Power Supplies and the original manual. The
extension antenna is in perfect shape, also.
Take a look at the pictures even if you are not interested in bidding. There
are some really nice shots of this "Scarce" receiver.

yes, it was some silly notes about improving FT-101 using MC1496P and
this was the reason for buying FT101B, but it later turned out that
MC1496P has an IP3 of -20dBm which would not be an improvement at all

Have borrowed several FT-Newsletters from DK3UZ to look at possible
improvements for FT-7 and FT-902, but didn't find anything useful,
most of the mods were more based on feeling than based on practical
experience

ICOM IC-735 HF TRANSCEIVER

This is one of ICOM's best transceivers of its time, a real workhorse that is capable of 100 watts continues duty. I used one in Africa on RTTY for a number of years. Is small sized and very easy to use.

This radio is stock, no mods and no extras. Cosmetically it rates an 8 and electronically a 9.5. Every function works. The radio is clean and has not been used by a smoker. Comes with SM-6 desk mic, used but working, a new copy of the manual and schematics, and a power cord. Has plastic door.

Will be properly packaged for shipment. Price is $445 plus shipping costs from 29609.

Thanks for reading.

Alan,
Check out the ICOM-718 and the YAESU FT-840 for bare bones operation. I've seen the ICOM for $569 and the Yeasu for a little more. I'd go for the ICOM because it has a built in SWR meter. A power supply at AES (not an ICOM) is $125, but you should be able to do better with a used one. Or try RAdio Shack.

Yes, I think I agree here. In fact, upon re-reviewing the Newsletters, someone mentioned that the original MOSFET's were actually better than the 1496 in most cases. Good point! However, not to sound like I'm contradicting myself, I have an unused 1496 sitting here along with parts boxes with all the parts needed to construct the mixer. I think I'll try it anyhow and see what happens. The receive is weak on the higher bands, especially 10 meters, and the bleed from close stations is terrible. I need to try something.

I'm not sure what opinion I have of the Newsletters at this point. Seems like a lot of experiments were tried and failed but others were successful. And at least some of the content does seem theoretical rather than "practical".

I haven't either offhand. It's 6 pin molex type deal. He may have to
order a 2nd power cable from icom. Knowing their prices on extra
goodies, it probably won't be exactly cheap. MK

4625. Kantronics KPC-2 TNC Documentation Help

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-06 21:32:10 UTC
From: radiotronicgizzmo <radiotronicgizzmo@spydercat.com>
Message-ID: <uPJr8.111951$K52.16870708@typhoon.tampabay.rr.com>
Source record: 45030

I just got 2 Kantronics KPC-2 Terminal Node Controllers (TNC) -- one old version and one 'new' with the KA node software.

I don't have any docs on the commands nor schematics. Nor can I find it anywhere on the web.

I got them on the air just using the standard TNC2 commands, but there is obviously alot more (KA node stuff, PERM, etc.,etc)

Can anyone help????

thanks

Hi ALL

I have 5 articles written by g3LLL in Ham Radio today (a Uk magazine now out of print).
These articles are well written and give much info on maintaining and repairing the FT101 range.

I think he had a double balanced mixer mod which proved succesful, and he alo designed an rf clipper for the early models without speech processing.

I have heard of the ft news group and would like to know how to get information to obtain the newsletters library.

I have a copy of the ft101 series service manual on a cd.

I also own 3 FT101E's. 1 works 100% and is in mint condx, the second one is 90% ready, the third is 80 % ready I bought the latter 2 a for spaers but unfortunately they appear to be fixable .

I also own a sommerkamp ft277B (ft101B again bought for spares) which is 60 % restored to working order but I need a vfo knob to make it complete. I am in need of 6js6c valves and i don't suppose i am the only one.

I am also restoring an ftdx401 but i am short of 6kd6 valve. they and the 6js6c's are getting as rare as rocking horse manure in the uk.

If anyone has any bits to swap or buy im interested.

>>
>> Walter
The IC02AT uses the same PL tone for the first 6 channels. You have
to store that in the first channel.

Press function + 1, enter the code for the wanted PL frequency, and
store it in channel 1 with the desired frequency, and offset,. Now,
the next 5 channels will have that PL frequency too. Have fun!

I've used douzens for MC1496P and MC1596P for several projects, also
S042P, but it is better devices around. Just got some SL6440, and they
have high IP3, so I don't understand a reason for using a bad device

In fact I don't see any point to waste time on FT-101/B or FT-221 or
FT-225 which are all made to same principles and suffers from bad
carrier oscillator leakage which upset AGC,. So without any chance of
good audio quality it is no point to waste the time,....but somebody
had a point: "It is a good transmitter". I usually prefer to hear what
the opposite stations says, but it is different opinions about that

I spent a week trying to find the reason for the problem with FT-101B,
but never succeeded, later tried it with FT-221, and withing a week I
managed to make only very inferior improvements. Although I had very
sensitive RF voltmeter available I couldn't trace what really caused
this radiation of carrier signal from the oscillator to an early stage
of IF, og possibly RF mixer. You can remove the carrier connection to
the product detector and still receive ssb signals as normal.

it was also a discussion concerning replacing diodes in product
detector to reduce noise. I never really understood what was the
point, it seems ridiculous to me.

Source record: 45038

Hello. I am looking for Ranger AR-3300 or AR-3500 10 meter radios. 30 watt or 100 watt models, black or grey. I would prefer working units, but will take non working units. Cosmetics negotiable. These are older 10 meter radios made by Clear Channel, not RCI models that are now made by Ranger Com.If you have any of these and would like to sell it for a reasonable price, please Email me direct. Again, reasonable prices only, these units are over 10 years old. I have cash or used commercial radio equipment if you want to trade. Thank you in advance!

>
>Vikrant

1.5GHz isn't that high, really. If the oscillator isn't some extremely cheap piece of crap, it shouldn't be that tough to demodulate BPSK from 1.5GHz. A Costas loop can still do the job of carrier recovery for BPSK. What is the symbol rate of the desired signal? The lower the symbol rate the harder the problem will be, but I would think that with a reasonable oscillator anything above about 32kbaud should be doable without too much trouble. Obviously, YMMV.

If, however, as you've hinted, the oscillator _is_ an extremely cheap piece of crap, there are a few options. Raising the symbol rate helps, since then the Costas loop bandwidth can be increased to span the bandwidth of the phase noise. If that's not possible, switching to differential detection or differentially coherent detection may help, although there are performance penalties associated with both (which may be preferrable to not being able to lock at all).

Hope that helps a little.

Cheers,

Hi from Normandy !

I need some help in order to set the squelch threshold level of an IC R70
which has got a bit too "high" with the time, causing muting of the rig
when
receiving very weak signals. The service manual is no more available at ICOM
/
France; I only have a circuit diagram of the receiver. Can anybody advise
me
which capacitor or resistor has to be re-tuned ?
I would appreciate any help very much .

73's and merci beaucoup !

Hi All,

Technial Topics in Radcom (RSGB) covered the problems of FT101 and strong signals and also offered a solution that I carried out and found to be very effective on my FT101B.

Details are August 1979 P739 & October 1979 P938.

Further details on request.

73's de Ned/EI5DS

4643. FS/FT: ALINCO DJ-162TD 2 METER HT $98

This is one of ICOM's best transceivers of its time, a real workhorse that is capable of 100 watts continuous duty. I used one in Africa on RTTY for a number of years. Is small sized and very easy to use.

This radio is stock, no mods and no extras. Cosmetically it rates an 8 and electronically a 9.5. Every function works. The radio is clean and has not been used by a smoker. Comes with SM-6 desk mic, used but working, a new copy of the manual and schematics, and a power cord. Has plastic door.

Will be properly packaged for shipment. Price is $445 plus shipping costs from 29609.

Thanks for reading.

I have an SB-200 for sale. It has been working just fine and looks pretty good. I also have a matched pair of Taylor 572B tubes which I purchased new from RF Parts as spares and have never taken out of their boxes. I want $350 for the amplifier and $75 for the pair of tubes. I am in Richardson, Texas, in the Dallas area and would be pleased to meet someone within a reasonable distance to deliver the stuff, but I do not want to ship them. I will be at the Belton hamfest. If you're interested please contact me at 972-231-7511 or via email. Thanks, Fred W5HTR.

Hummm, I knew about them, but didn't know they sold the molex rig
cords.
They are a good place to get anderson power connectors also, which I
recommend.
I use nothing else here for heavy duty power connectors. Everything I
have for 12v that draws any real current has an SB-50a on it. MK

AEA PK232MBX upgraded to PACTOR capability about three years ago. Still have original 1990 EPROM, if you wish. Comes with Manual plus updates, power cord, and new connectors for radio connections. You supply the specific wiring to your radio(s).

Unit is in very good shape, used only indoors and non-smoking environment. Only owner.

Asking $100.

TIA, Rick N6CY

4667. FS: MFJ 941 C Antenna Tuner

Tunes HF bands, 300W rating. More details available at MFJ site.

Unit in great shape electrically. Has been used extensively in many areas, including field day use. External appearance good, with marks. Great for traveling. Meter is intact electrially but is loose and needs to be glued back in place.

Asking $50 or best reasonable offer.

TIA, Rick N6CY

I believe that it is the same as the Dentron since Amp Supply was just a
follow on company after Dentron went under.

4670. VX-1R vs IC-Q7A

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-08 00:44:39 UTC
From: Michael <michael.s.coxNOTATHOME@attbi.com>
Message-ID: <XJ5s8.190258$Yv2.65844@rwcrnsc54>
Source record: 44976

I checked on Google, and the last instance of this thread seems to be a couple of years old. So, I thought I'd throw it out again.

Can anyone who has used/owned both of these radios provide a head-to-head comparison?

Secondarily, would I be nuts to go with such a small/low power HT as my first radio? I'm thinking I'll be doing more listening than talking for a while, and, with the small size, I'll be more likely to actually carry it with me. I know every situation is different, but would the collective wisdom of usenet be inclined to steer me away from this plan? Whatever you recommend, you can assume a single radio purchase in the under $150 price range.

Many thanks in advance!

Michael Cox
Plano, TX, USA

Source record: 44977

I presently own both radios and have had both for about 2-years. If I were you, I'd go with the VX-1r. You might not think it much difference between 300 and 500 mw. I can tell you from experience of using both radios that 300 mw is NOT enough. Actually, my Q7A did not put out the rated 300 mw, anyway, It did more like 220 mw on 2-meters and 180 mw on 440 with NEW BATTERIES and measured on Bird QRP wattmeter. The Q7A is presently on the shelf as it lost most of its sensitivity on 2-meter receive. It still transmits, but is down roughly 20 dB on receive.

I should mention my VX-1R has been through everything. When I am working outside (we live in the mountains of Northern Colorado) it is ALWAYS on my belt. It's been dropped in the sand, lost in the snow, and burried in the mud (untentionally, of course). It always comes out the winner! It's a nice radio, and it recharges in about 90 minutes. Besides, if you run it on the wall wart at 6 vdc, it will do a healthy 1-watt output - something the Icom Q7A won't do!. The VX-1R is a nice radio, and I think a bit more friendly than the Q7A as well. Yaesu done good on the VX-1R! I hope it doesn't go away until they can put the same capability in a wrist watch!!

4673. TS-820S Owners Manual and Service Manual Needed

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-08 01:16:12 UTC
From: Curtis Scholl <cscholl@umich.edu>
Message-ID: <3CB0EF5C.9090009@umich.edu>
Source record: 44975

Greetings:

I am in possession of a Kenewood TS820S Xcvr. The VFO does not seem to work and the Digital readouts are not working either. In any case, without some form of service manual I am dead in the water.

Symptoms are:

VFO indicator will not light up when VFO selected. FIX light works when FIX is selected. Audio Section works. IF shift works like the TS520SE and is working. When the 25Khz calibration is selected, no proper opertion is apparent. So, I am assuming the VFO section is dead or I don't know how to operate this thing anymore. I worked with a 520 and this looks very similar except for the digital readout and the black vernier dial.

What can I look for in the system while I am waiting for a service manual?

Anyone out there with photocopies of the Owner's manual and/or Service manual willing to make another ? Email the details to cscholl@izzy.net

Thanks

Curtis Scholl

4682. Alinco DR-605T Dual Band (Mobile) Cross Band Repeat Question

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-08 03:44:05 UTC
From: "Joseph B. Bitner" <jbitner@charter.net>
Message-ID: <ub24djs9f6jq2a@corp.supernews.com>
Source record: 44987

I recently purchased an Alinco DR-605T from Ebay. It's in excellent condition, and I'm generally pleased with the radio.

I can't seem to figure out cross band repeat. Actually, the way it's worded in the owners manual, I'm a bit concerned that it might not be capable of what I want. In the past, I've used cross band repeat, to make it possible to hit a certain repeater while out in the woods in my bicycle. I ride in some secluded areas, and the HT alone can't make it onto the repeater. So, I'd set the rig in my vehicle (on a nearby mountaintop) up to listen for me on 2m, and rebroadcast to the repeater in the 70cm side of the radio. And of course, the repeater crosses over to 2m, in my mobile rig, and broadcasts back to me. I can't seem to get this set up and running on the Alinco DR-605T. Can anyone offer me some assistance?

Thanks,
Joe

I have some excess stuff. Make me an offer or a trade.I'm interested in VHF
and UHF stuff.
1) MURA CBM-20 swr/field strength/watt meter 10watts/100watts
small but heavy for it's size
2) Para Dynamics PDC-550 larger and has 3 meters SWR/WATTS/MODULATION
forward and reflected switch
3 power levels 10/100/1000
swr and mod tuning knobs
3)B&W Model 595 - 6 position antenna switch.used but works.
4)MFJ Model 812B VHF SWR/Wattmeter
All items are used but working.

4687. Question regarding feedback in rig

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-08 11:30:40 UTC
From: VE3TMT <ve3tmt@rac.ca>
Message-ID: <sbfs8.7094$PQ.769216@news20.bellglobal.com>
Source record: 44992

Rig is a Yaesu FT900. On transmit, a slight bit of feedback can be heard through the speaker. Sounds like a speech monitor circuit, although not anywhere near the amplitude. Just enough to know it is there. Does it with both the D104 and the Heil HC5 mics. The rig is hooked into the computer sound card for digital modes, and I have an audio tap coming off the sound cards audio out line (the rigs tx input line) to a small external speaker that I use for monitoring the transmitted digital signals. Could this be a part of the problem? It doesn't sound like it is getting on to the transmitted signal, just more of an annoyance. And it does vary in amplitude as I adjust the mic gain on the radio.

I disconnected everything from the radio except for mic, power & antenna and it is still there. Antenna is a hidden longwire. Could it be an antenna issue? I don't have a dummy load to try.

Suggestions?

4692. Hamcom not copying CW

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-08 12:56:45 UTC
From: cprstn54zz@att.net
Message-ID: <3cb18fcf.210022437@news-server.optonline.net>
Source record: 44995

I am using a Vectronics adapter (VEC-1613) with an FT990/SP6 and an 8086 laptop.

Hamcom shows the frequency distribution (F7) and lets me match up frequencies (F9) and set the code speed, but nevertheless prints gibberish to the screen in CW mode (F2). Mostly t's and e's. I fiddled with the FT990 filters, the SP6 filters, volume (AF gain) and RF gain -- with no improvement. The signals are S5 or better and all are easily copied by ear.

Once in a rare while it does OK (two times in 30 tries, with maybe 80% accuracy), so maybe I am missing some parameter setting? Any help will be appreciated.

I have an RS-232 tester on the port (COM1) and can see the appropriate LED going on and off with the signal. I have tried RF/AF settings that have the LED going completely off when no signal and partly lit when no signal.

What gives with the hams who advertise here, on eBay, on QTH and eHam? I am finding that items that are supposed to be "working" and not "DOA" are arriving with blown fuses, covered in crud and with fried components. No way were these things working when shipped. So far, I have had three like this out of eight purchases. Luckily, all were fixable with inexpensive parts and bench time. At least when the seller says he hasn't tested it and is selling as is, you know what you are getting into.

The only other hobby I have seen with so much lying is fishing, but that is expected.

Hi Ken -- I have learned that on e-bay or on the news groups, I send an e-mail and ask if the unit is fully operational
in all modes in all respects and guarnteed money back if not. Also comestic condition if that is important to me.
If the seller sez as they sometimes do "I plugged it in and it lit up but I don't know any thing about how it works", then its worth a lot ask.

I have returned a few items because not as advertised -- but only a very few. And the sellers honored the agreement.

For those that falsify the condition of a rig, intentional or otherwise, they will get a black mark on e-bay and folks will stop buying from them -- many there earn extra income by e-baying and are foolish to short change some one.

And of course you have seen the bad guy alerts here -- so best be honest and I suspect 99% + of the Amateurs are just that.

My two green stamps worth.

4700. Icom IC-T81A Quad Band HT

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-08 20:18:02 UTC
From: Ross Hatfield <w8tz@qsl.net>
Message-ID: <_Vms8.16397$SG2.3489363@news1.news.adelphia.net>
Source record: 44903

I have for sale a Icom IC-T81A Quad Band HT. This radio will transmit and receive on 50, 144 and 440 mhz plus 1.2 gigaherts. It is in mint condition and has barely been used. It was kept in a vinyl case at all times. Broadband receiver covers FM and TV broadcast audio, 6 meter AM and FM, aircraft, public service bands, analog cellular image frequencies and much more. Includes the following accessories:

- Icom BC-119 DeskTop Charger ($89 from HRO not including radio adapter)
- Icom vinyl case
- Speaker mic
- Boom mic headset with earphone and PTT (this is brand new and never used)
- Lithium-ion rechargeable battery
- Rubber antenna
- Belt clip and strap
- Manual and all original boxes
- Serial number 001225

Pictures available....Price $275 plus shipping

Thanks, w8tz@qsl.net

4701. Kenwood TS-570 ready to be replaced by new model???

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-08 20:49:35 UTC
From: Karl Juul <karljuul@hotmail.com>
Message-ID: <znns8.56399$GF1.8704347@typhoon.nyroc.rr.com>
Source record: 44904

I'm in the market for a new transceiver and have been considering the Kenwood TS-570DG, but wonder if it's about to become an orphan... it was introduced 5 years ago which seems like a long product-cycle, plus I notice that Kenwood is offering a $200 rebate on this through 5/30/02, which is usually a good indication they are trying to deplete present inventory.

Are there rumors about what will replace the TS-570 and when?

Karl

Have you tried "reverse"? Sometimes that will help. I don't use that
program much anymore as I've gone all sound card, but when I did, the
most important thing to copy cw was probably the "F9" tuning setting.
I'd turn the ALC to "on", and then go to F9 and set the tuning needle
to be right in the middle of the two frequencies. Once you get it in
the middle, the ALC should keep it there if it's copying. If it still
doesn't work, then try the reverse, and also try to keep the CW speed
as close to whats being received as you can. Also I've noticed varying
the IF shift or passband tuning can help copy. I'm now totally
soundcard, and usually use hamscope for PSK31, RRTY, CW, etc. I think
it may well copy CW a bit better, but hard to say. You might want to
give it a try if you can run windows soundcard programs on another
box. Of course, this won't be happening on an old 8088 laptop...:(
You'd probably need a slower pentium or at least a fast 486 to run
that. I think a pentium 120 is recommended, but I'd have to check. MK

Probably the antenna. You probably have quite a bit of RF on your feedline, etc.
Not sure how you are feeding it. You have a good bit of rf floating around the shack, I'd say. If you can't change antennas, and the RF is not hurting anything otherwise, you'll probably just have to live with it. Grounding may or may not help. Normally , I would say it wouldn't be much help. The antenna and lack of decoupling from the feedline should be the real problem, not the ground or lack of it. MK

While hamcom was a very nice program for the time, I never could get it to copy CW very well. Unless the CW is machine sent many programs have a very hard time with it.

As they all said, Build one.

60 Inches of 300 ohm twin lead from Radio shack

About 6' of 1/2" PVC and a cap.

Somthing to pin through to hold the twin lead.

Coax to solder to it.

Use these dimentions

http://www.qsl.net/ai4hb/jpole.html

Your all set. I just built one and it performs outstanding on both
2m and 70cm

Rick KF7QZ

The 572Bs I had for sale have been sold. I still have the SB-200 for sale for $350. It has been working just fine and looks pretty good. I live in Richardson, Texas, which is in the Dallas area and would be pleased to meet someone within a reasonable distance to deliver the amplifier, but I do not want to ship it. Also, I will be at the Belton hamfest. If you're interested please contact me at 972-231-7511 or via email. Thanks, Fred W5HTR

4710. Re: Best Freeware Terminal program for PK-232?

Why not chunk the pk232 and just run some of the very good free sound
card programs found on this site>

http://www.muenster.de/%7Ewelp/sb.htm

Don't have the url handy but search for RASCAL for a simple audio
interface if you can' build the simple audio interface to the rig.

Source record: 44915

Sorry but I just can't see paying around $100 for a terminal program
to run a PK-232. I've somehow lost the floppy that had the old
PC-PakRatt software on it, may have been in a bunch of 5 inch stuff I
tossed about a year ago. Just interested in playing around a bit on some
of the digital modes and remembering all the commands for the PK-232
using Hyperterm is taxing my tired old brain.
Suggestions and links to some freeware or shareware would be
appreciated.

Anyone know what the 2 bulbs are that back light the LCD display on this old 2M transceiver. I unsoldered them from PC board in rear of display.

They have wire leads and the glass envelope is .120" dia and about .250" long. Any idea of voltage or lamp type? It appears to be a T-1 size but I don't know the voltage.

Help.

Tnx.....Jay ne2q@arrl.net

S:1. ADMINISTRIVIA

Q:1.1. What is an FAQ?
Q:1.2. Where can I get a copy?
Q:1.3. Where do I send feedback?

Welcome to the IC-746 FAQ.

Short Answer

FAQ stands for "Frequently Asked Questions". It tries
to cover common questions/problems/issues associated
with Icom's IC-746 HF/VHF amateur radio transceiver.

The master copy is kept at:

http://groups.yahoo.com/group/IC746/files/IC746-faq.txt

Mirrored copies (after a short delay) appear at:

http://www.qsl.net/kb9sss/IC-746/IC746-faq.txt

An older version (June 2001) is sitting at:

http://www.skysdaughter.com/icom746-faq

You do not need a Yahoo email account to access the
master copy, however, you will need a logon account.
Yes, that is a subtle but hopefully minor distinction.
Not everyone is willing to have a login account at Yahoo
(even if it is free), which is one of several reasons
for maintaining the mirror sites.

Also, we post the FAQ monthly to:

news:rec.radio.amateur.equipment

usually sometime between the 1st and the 10th.

You can post questions/comments about the FAQ to
the above newsgroup.

Long Answer

The format of this FAQ should become apparent right from
the start. Questions are grouped into related sections
and subsections, roughly in the form of an outline.
Questions start in column one with their composite

section number.

When possible/practical, there will be both a short
and long answer. The short answers will try to be
brief and to the point, typically about one paragraph.
While correct, quick, and immediate, it will often gloss
over subtleties and details. The long answers will cover
theory, alternatives, dissenting opinions, and other
supplemental material. We try not to unnecessarily
duplicate information between the answers (this one
is an example of that). Long answers may go on for
several pages.

The questions that are addressed here (as well as the
answers) come from several sources.

This FAQ was created by and is hosted by folks on a
Yahoo e-mail discussion group at:

http://groups.yahoo.com/group/IC746

www.qth.net hosts a more generalized Icom e-mail list
that covers all models, not just the IC-746. You can
lookup more information or subscribe to that list at:

http://mailman.qth.net/mailman/listinfo/icom/

Some of the info here originally appear upon a bbs
style on-line discussion group that used to be at:

http://vartel.com/icom746/icom746index.html
(site not responding Jan-2002)

There are also the following newsgroups:

news:rec.radio.amateur.equipment
news:rec.radio.swap

Specific comments or clarifications can be sent directly
to the FAQ coordinator. "Content submissions" would be
greatly appreciated. However, general discussion/debate
over the answers is best done in a more public forum,
like one of those mentioned above.

Q:1.4. What are the future plans for the FAQ?

Many have suggested/asked that the FAQ take on a
graphical rather than text format to better facilitate
charts, photos, diagrams, etc... The two front running
formats are HTML and PDF, each of which has advantages
and disadvantages. I now have the tools to do both
and will be persuing it the second half of 2002.

Most of the power supply information will be separated
out into a separate FAQ that is applicable to all rigs.
This fits in better with the new ICOM Resource pages at:

http://www.qsl.net/icom/

Q:1.5. What questions still need to be answered?

There are plenty of topics that still need or deserve
to be covered. Here are some topics and details we'd
like information on (in no particular order):

* Levels and impedances of all audio connections
(mic, phones, acc, etc...)

* We still do not have enough reliable reports to
confirm which "birdies" (if any) actually exist.

* How does one go about hooking the 746 up for PSK,
TNC, and CI-V operations at the same time.

* CW Zero-Beat confusion
(as well as BFO and "reverse" operation)

* More information on the front panel power switch
and its interaction with the extra pins on the
T-connector in the back.

* More service and repair information

* Better explanation of band stacking registers

* Operating tips

* Instructions on how to use internal ATU

* Better explanation of COMP (gain, FM, etc...)

* Compare/contrast the 746 vs 746PRO

We welcome and encourage submissions.

Q:1.6. What does this abbreviation or TLA mean?

Hams use a lot of abbreviations and TLAs (Three Letter
Acronyms), Toward the end of this document, is a small
glossary to some of the abbreviations we use in the FAQ.

==========

S:2. GENERAL INFO

Q:2.1. Should I buy an IC-746?

Yes. Try it, you'll like it.

This FAQ is maintained by happy, loyal, and devoted
IC-746 owners. What do you really think we're going
to say?

One thing nearly everyone (both loyalists and detractors)
agrees upon is that you should make every effort to
try out a rig before purchasing it.

Q:2.2. What are the IC-746's features?

For features, check out the IC-746 specifications
from brochures available at your local amateur radio
equipment store, on-line documents at various vendor
sites, or directly from Icom's WWW site at:

http://www.icomamerica.com/

On-line copies of the IC-746 sales brochure are at:

http://www.qsl.net/kb9sss/IC-746/IC-746-Brochure.pdf
http://groups.yahoo.com/group/IC746/files/IC-746-Brochure.pdf

Of particular interest might be the on-line copy of
the instruction manual.

Most of the 746's problems or faults show up either in
this FAQ (eventually) or in one of the archives at:

http://groups.yahoo.com/group/IC746
http://mailman.qth.net/mailman/listinfo/icom/

Q:2.3. How does the IC-746 stand up to the ______ ?

Probably the most objective, quantitative comparisons you
will find are the QST product reviews (freely available
to ARRL members):

http://www.arrl.org/members-only/prodrev/

Simpler, more limited, comparison charts are available
on the Amateur Electronic Supply WWW site at:

http://www.aesham.com/compare/comp_hf.html

User written reviews can be both more personal and
more detailed. They can also be more biased. You can
find plenty of them at:

http://www.eham.net/reviews

This topic has come up several times on Yahoo's IC746
discussion group. One of the more interesting threads
along these lines starts with message 1012 and ends
with message 1028. I'm told that message 1023 is
particularly good. Another good thread starts with 1049
and ends with 1077.

http://groups.yahoo.com/group/IC746/message/1012
http://groups.yahoo.com/group/IC746/message/1023

Q:2.4. Where can I buy/sell a used IC-746?

Usually when someone asks this on the internet, they are
looking for an on-line swap page. There are, of course,
plenty of other options. Most dealers have used/demo
equipment. Hamfests are a traditional favorite, as are
"swap nets" on HF.

That said; the two largest forums on the internet for
amateur radio gear are the USENET newsgroup

news:rec.radio.swap

and the infamous eBay auction site.

http://www.ebay.com

"Amateur Radio Trader" is both a magazine and a WWW
site devoted to amateur radio classifieds:

http://www.amradiotrader.com
(site not responding Jan-2002)

Yahoo has a small auction site as well:

http://list.auctions.shopping.yahoo.com/23761-category.html?alocale=0us

After those, you have your choice of dozens of
dedicated swap sites on the net. A few of them are:

http://www.arrl.org/RadiosOnline/
http://www.qrz.com/forum/
http://www.eham.net/classifieds/
http://www.k1dwu.net/hamtrader/

AC6V maintains an entire list of swap pages as part
of his excellent ham links/resource site.

http://www.ac6v.com/swap.htm

Q:2.5. How much is a used IC-746 worth?

Unlike used cars, there is no official "blue book"
for ham equipment. Only YOU can decide this.

Your best bet is to peruse the archives for

news:rec.radio.swap

over the past 6 months or so.

You might also check out one of the following sites

Electronic Boneyard Prices:

http://www.geocities.com/CapeCanaveral/Hall/8701/ham/boneyard.htm

E-Bay prices:

http://aade.com/hampedia/prices.htm

Virtual Hamfest - Recent Prices:

http://www.vhamfest.com/prices.html
(site not responding Jan-2002)

Good luck.

Q:2.6. Is there a dedicated HF net for the IC-746?

Yes, one was started in October, 2001.

It convenes 20M SSB near 14.2525 Mhz +/- QRM, on
Sunday evenings at 9:00pm Eastern time (6:00pm Pacific).

The folks that run the net shift it along with Daylight
Savings Time in the U.S.A. Therefore, during "standard"
time (last Sunday in October to the first Sunday in
April) the net starts at 0200 UTC Monday. During
"savings" time (first Sunday of April through last
Sunday of October) the net starts at 0100 UTC Monday.

For the curious, not all of the U.S.A. participates in
"daylight savings time". Likewise, portions of Europe
participate, but on a different timetable. A wealth
of information on DST can be found via Yahoo at:

http://dir.yahoo.com/Science/Measurements_and_Units/Time/Daylight_Saving_Tim
e

or within the AC6V link indices at:

http://www.ac6v.com/opaids.htm#CLOCKTIME

or directly from NIST (the National Institute of
Standards and Technology) at:

http://www.time.gov

The folks in the Yahoo IC746 e-mail group try to maintain
a net calendar at:

http://groups.yahoo.com/group/IC746/calendar

Yes, you have to be a member of the e-mail group to
access their pages, but as a fringe benefit, you'll even
get an automatic e-mail reminder on the day of the event.

We've heard of a few other HF nets devoted to Icom
equipment in general. They meet at:

Sunday, 1700 UTC, 14.317 Mhz ssb
Sunday, 2100 UTC, 14.317 Mhz ssb

Q:2.7. Are there electronic copies of 746 instruction manuals?

YES! During the first week of November, 2001, Icom
made an electronic copy of the IC-746 Instruction Manual
(along with many others) available on their WWW site at:

http://icomamerica.com/support/documents/index.html

A backup copy of the manual is stored in the IC746
Yahoo group's "Files" area at:

http://groups.yahoo.com/group/IC746/files/IC-746-Instruction-Manual.pdf

as well as at the QSL.NET ICOM Resource pages:

http://www.qsl.net/kb9sss/IC-746/IC-746-Instruction-Manual.pdf

Additionally, the FCC posted the IC-746pro instruction
manual (and various other documents) at:

http://gullfoss2.fcc.gov/cgi-bin/ws.exe/prod/oet/forms/reports/Search_Form.h
ts?mode=Edit&form=Exhibits&application_id=740578&fcc_id=AFJIC-746PRO

A backup copy of both parts of this manual is stored
in the IC746 Yahoo group's "Files" area at:

http://groups.yahoo.com/group/IC746/files/IC-746pro-Instruction-Manual-1.pdf

http://groups.yahoo.com/group/IC746/files/IC-746pro-Instruction-Manual-2.pdf

Another good place to look for on-line manuals is:

http://www.mods.dk/

While Icom has relaxed a little in providing these
documents, they are still protected by copyright.
Please, treat them accordingly. Remember, Icom is
doing us a favor.

Q:2.8. Are there electronic copies of 746 service manuals?

No such copies are known to exist, although they would quickly become popular if they did. As of May 2001, Icom had no plans for releasing one. Additionally, Icom considers any such external productions to be a violation of their copyright. Ray (the product manager at the 2001 Hamvention) was very firm on this.

Hard copies are available through any Icom retailer as well as through the W7FG Vintage Manual WWW site at:

http://www.w7fg.com/

Q:2.9. How do I fix the font substitution error in the PDF manual?

When trying to read the PDF version of a 746 Instruction Manual with the Adobe Acrobat Reader, some people encounter the following three dialogs on page 10 of the document (PDF page 12).

A font required for font substitution is missing.

An error has occurred that may be fixed by installing the latest version of the Japanese Language Support package.

Unable to find or create font "Ryumin-Light-Identity-H". Some characters may not display or print correctly.

The error is not fatal. There are a few dozen places in the manual where text in diagrams will show up as a series of dots.

You can get rid of the error by downloading the appropriate Asian font package directly from Adobe's support pages. As of November, 2001, the appropriate link was:

http://www.adobe.com/support/techdocs/2a156.htm

Q:2.10. How does an IC-746s differ from an IC-746?

Japan has a 3rd Class license that is power limited (sort of like the defunct US Novice class). The IC-746s is identical to the IC-746, except that it caters to this limited operating class. It's output power is limited to 10w on HF and 20w on VHF.

Nobody has yet reported a "mod" for this rig to bring its power up.

Q:2.11. What is the IC-7400?
Q:2.12. What is the IC-746-PRO?

These are both successors to the IC-746. The IC-7400 is the Japanese version while the IC-746-PRO is the English version. We don't know yet what else (if anything) differentiates them besides their name.

There are two ways to look at the IC-746-PRO. Some view it as a beefed up IC-746 while others view it as a watered down IC-756-PRO. On the outside, it looks and operates very much like the IC-746. The controls are similar enough that you confuse the two. However, the inside (RF chain and DSP) is more like the IC-756-PRO than anything else.

Here are some features that the IC-746-PRO has over the IC-746:

+ 32bit DSP with 24bit ADC
+ Selectable digital filters (50+)
+ Sharp or Soft filtering (via DSP)
+ Digital TPBT
+ Manual digital notch filter (in addition to ANF)
+ Twinned Digital APF (great for RTTY?)
+ DSP based RTTY decoder
+ Adjustable digital noise blanker
+ Digital TX/RX equalization (instead of analog)
+ Digital speech compressor (instead of analog)
+ Digital voice recorder

You'll notice how prominently the DSP plays in this rig.

One thing the original 746 has over the 746-PRO is an additional IF stage, thus its TPBT is actually going through two offset IF filters. The 746-PRO achieves its TPBT via the DSP. Its argued that the DSP filtering more than makes up for the lack of the extra filter and is more programmable/flexible. It's counter argued that DSP filtering is not as effective as traditional IF filtering (the 746-PRO instruction manual even eludes to this) and that insufficient filtering early on overtaxes the DSP.

Both are excellent rigs and only time will tell just how effective DSP really is. Perhaps someday Icom will make a rig with both.

Here are some of the features the IC-756-PRO has that the IC-746 does not.

- Dual watch receiver design
- Real-time spectrum scope

Additionally, the IC-746-PRO retains the basic form
factor, LCD, control layout, and bonus 2m capabilities
of the IC-746.

Plenty of sales and technical information is available
(including downloadable pictures and brochures) from
Icom's WWW site at:

http://www.icomamerica.com/

There is a Yahoo discussion group devoted to the IC-7400,
as well as a group devoted to the 746 series in general.

http://groups.yahoo.com/group/IC7400
http://groups.yahoo.com/group/IC746

Icom has not yet made a copy of the IC-746-PRO
instruction manual available in electronic form, however,
the FCC has. You can access it and other information at:

http://gullfoss2.fcc.gov/cgi-bin/ws.exe/prod/oet/forms/reports/Search_Form.h
ts?mode=Edit&form=Exhibits&application_id=740578&fcc_id=AFJIC-746PRO

And a nice ham-written synopsis appears at:

http://www.qsl.net/ab4oj/ja7ude/ic7400.html
http://www.qsl.net/ab4oj/icom/ic7400/ic7400.html

Q:2.13. Where can I find info on other Icom rigs?
Q:2.14. Where is info on the 706, 718, 756, 765, 735, ...

This FAQ is devoted to the IC-746. As of November, 2001,
we do not know of any FAQ's devoted to other Icom models.
However, as of Jan-2002, a project was underway to start
accumulating and centralizing Icom information at:

http://www.qsl.net/icom/

While the coordinators of this list already have their
hands full, they would be glad to advise, help, and
collaborate with people interested in maintaining
other FAQs.

Much of the generic information in this FAQ is applicable
to other Icom rigs, but please, use common sense when
trying to apply it.

For general information on other Icom rigs try:

Icom's WWW site at:

http://www.icomamerica.com/

Icom e-mail discussion group at:

http://www.qth.net

Usenet newsgroup:

news:rec.radio.amateur.equipment

The definitive collection of "mods" for all makes and models of amateur radio equipment is at:

http://www.mods.dk/

Yahoo Groups hosts more than 40 e-mail/WWW discussion groups related or devoted to Icom equipment. Here are some of the more than 50 Icom related groups there.

http://groups.yahoo.com/group/icomr2
http://groups.yahoo.com/group/ICOMR3
http://groups.yahoo.com/group/ic706
http://groups.yahoo.com/group/ICOM706
http://groups.yahoo.com/group/IC-706Mk2G
http://groups.yahoo.com/group/IC-756PRO
http://groups.yahoo.com/group/ic756pro2
http://groups.yahoo.com/group/IC-Q7
http://groups.yahoo.com/group/IcomRadio

IC-765 information pages

http://www.execulink.com/~dstalk/

Last, but certainly not least, AC6V has a wealth of links and resources on amateur radios.

http://www.ac6v.com/swap.htm

Q:2.15. What articles have been written about the IC-746?

A Quality Sound Card Interface for ICOM Rigs

Lewis, Bob, AA4PB
March, 2002, QST, p.31

A great way to capitalize upon ACC port 1.

Solving Sound Card Microphone Problems

Covington, Michael A., N4TMI
June, 2000, QST, p.61

Shows a tiny, phantom powered, mic preamp

Automatic Amplifier Selection for the ICOM IC-746, IC-736 and IC-706MKII Transceivers

Hewitt, Paul, WD7S
May, 2000, QST, p.33

Operating via the ACC connector (thus bypassing
the SEND relay), this project provides automatic
amplifier keying (with ALC selection) based on
the Icom band signal.

A Direct Frequency Entry Keypad for ICOM Transceivers

Hansen, John, W2FS
December, 1999, QST, p.38

Adds an external keypad via a PIC and CI-V.

ICOM IC-746 MF/HF/VHF Transceiver (Product Review)

Wolfgang, Larry, WR1B
September, 1998, QST, p.70

A product review article

Der Neue von Icom: IC-746 - mit 100w und DSP auf 11 Bandern

Petermann, Bernd, DJ1TO
April, 1998, Funkamateur, p.392

A product review article (German)

A Remotely Controlled Antenna Switch

Thompson, Nigel, KG7SG
April, 1993, QST, p.32

Uses the band signal on the Icom ACC connector
to remotely switch between antennas with a
single feedline. (This article predates the 746,
but is still appliccable)

==========

S:3. Accessories

S:3.1. Power Supplies

Q:3.1.1 What power supply should I use with the IC-746?

Short Answer

Any good quality, communications grade, power supply
rated at least 20 amps or more (continuous duty) should
do just fine. However, most of us use larger supplies
(for a variety of reasons).

Popular supplies that are known to work (via testimonial):

Alinco DM-330MVT 30/32A switching
Astron RS-35M 25/35A linear
Astron SS-30 25/30A switching
Astron SS-25 20/25A switching
MFJ 4125 22/25A switching (MightyLite)
MFJ 4225 22/25A switching
MFJ 4035-MV 30/35A linear
Samlex SEC-1223 23/25A switching
Kenwood PS-52 20/22A linear

Power supplies to avoid (via testimonial):

Astron RS-20 - overloads too easily
Kenwood PS-30 - overloads too easily
Diamnond GZV-4000 - RF hash on 40/20m

Long Answer

This question typically arises for one of two reasons. Either someone wants to buy a new power supply, or they have an existing power supply that they want to use. In both cases, the issues are: load capacity, size, weight, electrical noise, mechanical noise, cost, features, and appearance. Buying a new supply gives you a lot of options; there are plenty of great supplies out there. With an existing supply, you have no control over these factors; you're simply looking for a "fit".

You'll want to consider the following factors.

Reviews

QST tested and reviewed many supplies in January and September, 2000. You'll find the results informative. ARRL members can access those and other reviews on-line at:

http://www.arrl.org/members-only/prodrev/pdf/pr0001.pdf

http://www.arrl.org/members-only/prodrev/pdf/pr0009.pdf

Transportability

The larger the capacity, the larger and heavier the supply. If size and weight are critical for you, consider a "switching" supply as they are usually less than half the size of a "linear" supply.

Electrical Noise

All supplies generate some electrical noise. Typically the noise from linear supplies will be in the form of AC hum while from switching supplies the noise will be RF hash. Communications grade power supplies of either type are designed to minimize the noise, and generally

cause no problem. (i.e. this is not a good place to cut corners)

"Computer" power supplies that are pressed into radio service are particularly bad when it comes to electrical noise.

Usually, the harder you push a supply (the heavier the load), the worse the noise will become.

Mechanical Noise

Many supplies have cooling fans. Sometimes, the fans are loud enough to be a noise problem themselves. Fan noise is variable from supply to supply (even within the same manufacturer and model). Likewise, hearing tolerance varies from operator to operator. Thus, it's hard to tell in advance if a specific supply will have a problem. Time may yet tell.

We do know that fans are driven by load. The closer you operate to a supply's capacity, the more the fan runs.

Also, some of the transformers used in linear supplies will generate an audible hum. The transformer itself vibrates with the AC supply. Mass seems to help here. Usually (not always) the heavier the transformer, the less the hum.

Its pretty easy to put a noisy power supply under a table, behind a cabinet, or elsewhere to cut down on the noise level. Just be careful to allow proper air flow for cooling.

Features

Most of us consider current limiting, over voltage protection, and high temperature shutdown to be mandatory in a new supply.

Fuses or breakers are required for UL certification. Buy spare fuses right away; they never blow at a convenient time.

Meters are non-essential, they are luxury items. They make the supply bigger and more expensive. However, they can be very handy and even fun. Lets face it, most hams enjoy gadgets.

Adjustable output voltage is a useful feature, more useful than you might realize. Most new supplies have it (usually internally).

Load Capacity

The size, weight, and cost of a power supply all tend to increase with its load capacity. Those factors encourage us to get the smallest supply we can. There are also factors that encourage larger supplies; such as noise, heat, accessories, etc...

The IC-746 specifications list a current drain at maximum transmit power of 20A at 13.8Vdc. Thus, the recommendation that your supply should handle 20 amps (or more) continuously.

It is possible to run the IC-746 with a smaller supply, but extreme caution and discipline are required. Very few, if any, of us recommend it for normal operation.

For example, the 20 amp maximum in the IC-746 specifications is full key-down at full power. You could just lower your RF power to help match your load to the supply. You could even run the IC-746 QRP, drawing as little as 3-4 amps on transmit.

Another factor is operating mode. Some of us have measured full-key loads as high as 21-22 amps. Normal SSB transmit at full power draws 6-15 amps. But FM, digital, and CW will generally pull 18-20 amps at full power.

Continuous vs. Intermittent Load

There are issues concerning a supply's "intermittent", "peak", or "surge" capacity. A supply might be rated for 16 amps continuous and 20 amps peak. Normally, the IC-746 runs at about 2-3 amps for receive and only hits the 20 amp maximum during transmission. Thinking of transmitting as "peak" or "intermittent" activity can lead one to think that such a supply is acceptable. It might even be. However, a problem develops when we try to define what peak or intermittent activity is.

Everyone would agree that transmitting for 3 minutes at 20 amps till the repeater time-out cuts you off is not a peak. How short a time constitutes a peak and at what duty cycle? Without some sort of specification or standard, "peak" and "intermittent" could mean just about anything. Most of us feel more comfortable with a "better safe than sorry" approach.

This dual rating system for power supplies is a great source of confusion. Specifically, you could buy a power supply rated for 20A and have it fail under full load. The Astron RS-20 and Pyramid PS-21 are examples of such supplies. While both are excellent supplies, they just can't keep up with an IC-746 under full power.

The exact definition of intermittent, peak, or surge
as used by the power supply manufacturers has not
been established.

(Some of us are going to try to talk to the
supply manufacturers about this to get more
details)

To quote a tech from Samlex:

Maximum rating is surge current requirement for
starting reactive loads or short term dynamic
loading and is limited to a few seconds.

This supply is not designed for pulsing loads.

Currents beyond the maximum rating will force the
unit into current limit and the output voltage
will drop and it will no longer be regulated.

Meanwhile, MFJ said (of the MFJ-4322):

Our units will shut down at surge. At 25 amps
surge, the power supply will shut down at about
ten seconds.

So while it is theoretically possible, most people do
not use supplies rated less than 20 amps continuous.
In fact, most use substantially bigger supplies.

Bigger Supplies

Why use a bigger supply? There are several reasons.

As noted earlier, the closer you operate a supply to
its rated capacity, the greater the electrical noise,
mechanical noise, heat, etc...

Strain leads to wear-and-tear. So it can be argued
that a bigger supply should last longer.

The IC-746 is rated at 20 amps max, but loads as high as
21-22 amps have been measured. "Your mileage may vary"
definitely applies.

The continuous rating is generally based upon an
ambient air temperature of 20 C. The rating degrades
as the temperature rises, by how much, we're not sure.
Filed Day conditions will be stressful to your supply.

13.8 V times 20 A yields 276 watts. There's a tendency
for some supplies to drop voltage a little when they
get hot or overloaded. There's also a tendency for
some radios to increase their current pull when the
voltage drops. At 12 Vdc, that same 276 watts would
imply 23 amps. You push the supply capacity, which

drops voltage a little, which drives the rig current
up, which pushes the supply further ... then BANG.
You blow a fuse. (AK6R has actually seen this effect
with his 756pro)

There are plenty of other devices that need DC power.
You need to account for them as well.

Other and future rigs may have greater power demands
(like the 756pro). Extra capacity now may avoid the
need to upgrade your supply in the future.

You might well spend most of your time in a low power
situation (SSB QRP) and get by with less than 5A.
But, in an emergency, you and your gear may be called
upon to operate in different modes, at higher power,
and with heavier duty cycles. Planning ahead for the
worst case usage helps prevent an untimely failure at
just the wrong time.

Conclusion

So, you'll find most of us with power supplies ranging
from 20 to 30 amps continuous; and some with even
bigger supplies.

S:3.2. Antennas

Q:3.2.1 What antenna should I use with the IC-746?

Short Answer

Any antenna you want.

Long Answer

Seriously. ANY antenna will work with the IC-746,
with the proper interfacing. People have even made
contacts using dummy loads.

Antennas are probably the most uniquely individualistic
aspect of any ham station. Antenna selection is a BIG
topic; much too big to deal with in an FAQ (at least
for this one).

The IC-746 has 50 ohm, unbalanced, coaxial RF outputs.
With the automatic ATU capable of handling SWR mismatches
of up to 3:1 on HF (and 2.5:1 on 6 meters), you have
a wide variety of choices available to you.

There are many excellent books on the topic; the ARRL
has a couple dozen of them. A good one to start with is:

The ARRL Antenna Book

At over 800 pages (and over 1,000 antennas), you're
sure to find SOMETHING that fits your style and budget.

For more information, try hanging out on one of over
50 e-mail groups on the topic at

http://groups.yahoo.com

or visit one of the hundreds of antenna oriented WWW
sites indexed by AC6V:

http://www.ac6v.com/
http://www.ac6v.com/antprojects.htm

or follow along with the discussions on the newsgroup:

news:rec.radio.amateur.antenna

or visit the on-line antenna magazine:

http://www.antennex.com/

or, you could just put up a trusty old dipole.

Just be sure you do use an antenna. The IC-746 does not
like to transmit into an open load (no connected antenna).
It will put an undue (and possibly fatal) strain on your
output transistors.

Q:3.2.2 What range can the automatic antenna tuning unit (ATU) handle?

Officially, the automatic ATU in the IC-746 can handle SWR
mismatches of up to 3:1 on HF and up to 2.5:1 on 6 meters.
In practice, many people get even wider ranges.

The ATU does not function on 2 meters.

Some have pointed out that, even though the internal tuner
may tune a particular antenna configuration, if there
is a high SWR, you could end up burning out the tuner.

We have at least one case (reported by KG6GLN) where the
detector diodes in an IC-746 were fried. According to
the ICOM tech, "... it could happen if you tried to
use an external antenna tuner in conjunction with the
internal tuner. "

Q:3.2.3 Will the internal ATU handle "random" wire antennas?
Q:3.2.4 Will the internal ATU handle "long wire" antennas?

No. You'll need an external ATU.

The internal ATU can only handle an SWR mismatch of
about 3:1 on HF and 2.5:1 on 6 meters. Such antennas
will exceed those limits somewhere, over stressing
the ATU and possibly blowing it out. Matching will be
hit or miss (mostly miss).

Of course, there's always an exception. N4EUK reports
successfully tuning his 100 foot wire antenna using
the internal ATU. Even he was surprised.

Q:3.2.5 Are there any "tips" to using the ATU?

You mean, besides the tips already provided on page 58
of the Instruction Manual? Yes.

The ATU appears to pay attention to the reflected
power, not the SWR. [Note: we'd love someone to
analyze the schematics to confirm or deny this.]
This is evidenced by two effects.

When starting from a close match at QRP power levels,
the auto ATU doesn't always home in on the best match.
Increasing the power level and tuning again often
improves the match, which the ATU then retains when
returning to QRP power. In fact, the manual mentions
at least 8w on HF and 15w on 6m.

The converse situation can also cause trouble.
When starting from a poor match at full power, the auto
ATU sometimes can't find a match at all. In this case,
tuning at lower power allows the ATU to get a match,
which the ATU then retains when returning to high power.

If one end of a band consistently gives you trouble
while the other end tunes easily, then you may still
be able to coax the ATU into matching the antenna.
Start in the portion of the band where the ATU works
and tune there. Then, move your way across the band
in increments (maybe 25Khz at a time), tuning as you
go until you reach the desired portion.

Q:3.2.6 Can I use the internal ATU along with an external ATU?

Maybe. Theory says yes, but Icom says no. The results
are mixed. Use at your own risk.

Many people use an external ATU along with their IC-746. Usually, they leave the external ATU switched to "bypass" and let the internal ATU do its thing. For troublesome bands/antennas, they turn off the internal ATU and engage the external one.

Others use an external ATU to match their antenna to the middle of the desired band and let the internal ATU handle the rest. In theory, the ATU doesn't know or care what's hooked up to it; it simply tries to match up to the impedance it sees.

In most cases, either of the above approaches work fine. Many hams have been applying both for years with no problems.

However, some IC-746's have had their ATUs go out from fried detector diodes and driver transistors. On many repairs, Icom has blamed the failure upon external tuners. One ham was told that external tuners can cause problems even when they are switched to "bypass".

Nobody has been able to adequately explain why an external tuner would cause such damage, particularly when bypassed. Some speculate that tuning with low power is safer than tuning with high power (if nothing else, its at least more polite).

We need more information on this, but at least you've been warned.

Q:3.2.7 Does the internal ATU work on receive?

Yes. The internal ATU is enabled while receiving. Of course, it can only "match" while transmitting.

It's unclear if the internal ATU acts as an additional preselector when enabled.

Q:3.2.8 Any other "gotchas" with the internal ATU?

We've already mentioned above the possible hazard of using the internal ATU and an external ATU at the same time.

We've also mentioned above that operating the internal ATU at the limits of its abilities might overtax it over time.

A possible problem we haven't already mentioned may stem from the possible similarity between the IC-746 and the IC-756. The IC-756 users have been warned not

to use either their "Auto Tune" or "PTT Tune" features
while on 6m. (even the manuals mention this, although
in passing). Several have damaged their internal ATUs
this way, causing them to get stuck in 6m operation
after damaging the relays.

It has been speculated that some of the reported mishaps
with the IC-746 internal ATU with 6m may be related.
It's not hard to imagine that the 746/756 share a common
ATU design. We'd appreciate someone (with access to
both service manuals) doing a detailed circuit comparison
to confirm/refute this.

Finally, the internal ATU is only matching at the
internal PA. You'll still have high SWR out on your
coax, as expected.

Q:3.2.9 How do I use a "beverage" antenna?
Q:3.2.10 How do I use different antennas for receive vs. transmit?

As previously stated, nearly ANY antenna can be used
with the IC-746, provided it can be matched to the
746's 50 ohm, unbalanced antenna terminals. However,
there is more to using a "beverage" antenna than just
impedance matching.

Beverage antennas tend to sacrifice gain in order to
improve their signal to noise ratio. So, while they
are good for receiving, they are poor for transmitting.
Therefore, you would typically use a separate antenna
for transmitting.

Split VFO Method

While not convenient, the IC-746 can be configured to
use one of its antenna ports for transmitting and the
other for receiving. Run the rig in split mode with
both VFOs on the same frequency, but have VFO A use
antenna 1 and VFO B use antenna 2.

External Antenna Switcher Method

A more traditional approach (albeit, more work) is to
take the HF transmit signal from one of the accessory
ports activate a coaxial relay (via a driver transistor)
to switch between antennas. This is the same basic setup
you would use to control an external amplifier.

(refer to articles and external amplifier questions
for more information)

External RF Sense Antenna Preamp Method

Some manufacturers make antenna preamps that sense the RF
on the line to switch between antennas as well as switch
in/out the preamp. The Ameco PT3 preamp is one example.

Q:3.2.11 How do I measure SWR while in SSB?

Usually, you don't. Measuring SWR requires a signal.
The only way to get a signal on SSB is to modulate;
i.e. you talk.

The simple thing to do is to switch modes to either
AM or RTTY briefly. After making your measurement,
switch back to SSB.

Q:3.2.12 How do I tune up in CW without a key?

Usually you don't. You probably don't even want to
be in CW mode without a key.

Odds are, you're trying to tune up for a different
mode, for example, PSK on SSB. The simplest thing
to do is switch briefly to AM or RTTY and tune there.

If you insist upon tuning up in CW without a key,
then you really only have one option; simulate a key.
You could turn on the mic-keyer, which uses the scan
buttons (UP/DN) operate the keyer. Or you could wire
up a dummy key jack and key the rig by plugging the
dummy jack in and out. There's even one ham who uses
his headphones as a dummy key, but very few of us are
willing to take that risk!

Q:3.2.13 Can I make the TUNER button activate an external ATU?

Yes. The IC-746 has a connector designed to directly
connect to the Icom AH-4 automatic antenna tuning unit.
Page 80 in the instruction manual describes hookup and
operation. Once installed, pressing the TUNER button
for 2 seconds will cause the rig to transmit 10w in CW
mode until the AH-4 finishes.

In fact, there's a whole WWW site devoted to the AH-4.
Check it out at:

http://www.hamoperator.com/ah4/ah4.htm

Connecting and operating an LDG tuner is exactly the
same; they even make a cable specifically for the task.

Connecting and operating an SGC tuner is almost the
same; you'll have to make your own interface cable.
Instructions for that are at:

http://www.sgcworld.com/products/Couplers/icom706.html

Sure, the page says its for the IC-706, but the external
ATU interface is identical to that of the IC-746. Once
wired up, operation will be just like for the AH-4.

Finally, you could just fake the IC-746 into thinking
that there is an ATU out there with a dummy plug like
that available from W2ENY at:

http://members.fortunecity.com/w2eny/tenatuner/

Operation is similar to that for the other tuners, but
transmission stops after an 8 second timeout instead of
by tuner acknowledgement. You can even build this
yourself based on the information at:

http://www.mods.dk/mods.php3?radio=icom&model=ic-706&selectid=1864

Don't mind that the info says its for the IC-706, all
Icom rigs from this era use the same circuitry/connector.

Q:3.2.14 Why doesn't the rig SWR meter match my external SWR meter?

Its normal for different points along the RF "feed"
to register different SWR readings. The SWR meter in
the 746 reads the SWR between the final amplifier stage
and the tuner. Your external SWR meter reads the SWR
between the tuner and the antenna. The external meter
should always read greater than or equal to the meter
in the 746.

Its actually possible to "match" your rig to your
antenna by simply changing the length of your feedline.
For an extreme (but very workable) example, check out:

http://www.qsl.net/w5dxp/notuner.htm

This is not to say that the internal SWR meter is
accurate. Posts that suggest that the internal SWR meter
reads lower at lower output power than at full output
power. The effect is noticeable, but not pronounced.

Q:3.2.15 Which SWR meter should I trust: internal or external?

Both can be trusted, but tune by the internal meter.

You probably care because you are using an external
ATU. Tune to bring the internal meter to a minimum

reading. Its the meter that tells you how happy your
RF power transistors are and whether or not you're
suffering SWR power foldback.

S:3.3. Microphones

Q:3.3.1 What is the best microphone to use with the IC-746?

In theory, your favorite microphone is the best choice,
provided you hook it up and adjust it properly.
Its basically just a matter of personal preference.

The confusion lies in the definition of "best".
Most users generally agree that the stock hand mic is
generally adequate for general use, but is not "best"
or "optimal" for any specific use. You know the tale;
jack of all trades, master of none.

If you want better transmit fidelity (or even broadcast
quality sound), then you'll want a full range microphone,
possibly with a dynamic element. Icom's own SM-20
gets good reviews for this application, as does Heil
Goldline microphones. Other microphones will also work;
these just happen to be the most popular.

Many operators have found that the inexpensive studio
microphones from Radio Shack work astonishingly well.
Yielding 90% of the performance at 10% of the price
makes this a viable, budget conscious, choice. It
also shows just how poor the stock mic is.

If you're after more "punch" for DXing or contesting,
then you'll want to look into one of the Heil DX
style microphones. They're frequency responses have
been tailored to accentuate the portions of the voice
spectrum that most contribute to understandability.
Their great performance have made them very popular.

For those of you who "want it all", Heil even makes
a microphone that switches both ways, literally.
It has two pick-up elements in the same mic, so you
can change between ragchewing and DXing punch at the
flick of a switch.

Who says you can't have your cake and eat it too?

Q:3.3.2 Can I hook up a different microphone directly to the IC-746?

Yes, but only if properly wired.

There is more to wiring up an external microphone than just the differing pin-outs. You will also have to deal with: DC bias, signal level, and impendence.

Icom uses electret elements and incorporate preamps right into their hand mics. The DC power is fed directly from the rig through the mic cable. If you are using a different electret microphone, by sure it will operate with the 8 Vdc bias. When using a dynamic microphone, be sure you have a capacitor (value not critical, around 1.0-4.7 uf) in the circuit to block the DC supply voltage

Depending upon the microphone, you may have to use a hefty amount of mic gain (and possibly compression as well) to make up for the lack of the handset pre-amp. You may even need to use an out-board microphone preamp to get the signal high enough.

Finally, the Icom microphone input is at a relatively high impendence (1-2K ?). A matching transformer (or preamp) will yield the best results. Most microphones operate at only 600 ohms impendence, and the impedance mismatch will exacerbate the signal level deficiencies. Some microphones operate at much higher impedances (as high as 100K) and, unmatched, will suffer from distortion in addition to signal level problems.

Since you're already wiring up a new mic cable, you might want to short pins 6 and 7 with the chassis ground to assure that they are at the same ground potential. This often helps reduce RFI from coming in through the mic cable.

Q:3.3.3 Can I use a Heil microphone with the IC-746?

Yes, most Heil microphones work well with the IC-746. Bob does this himself.

As with any dynamic microphone, be sure you have a DC blocking capacitor in the circuit to isolate the mic element from the DC supply voltage Heil's pre-wired mic harnesses are perfect for this.

A notable exception is the HS-706 which (as the sales literature clearly states) ONLY works on the IC-706 series.

Q:3.3.4 How do I adjust the IC-746 for a Heil headset?

In theory, the IC-746 has enough microphone gain to use
an unaided Heil microphone. Heil's May, 2000, newsletter
discusses this topic, see:

http://www.heilsound.com/newslettermay00.htm

In short, you use moderate mic gain (50-75%, 12-3
o'clock position) along with moderate compression
(8-10db, 12-1 o'clock position) for the best results.

Q:3.3.5 Do I need a pre-amp to use a Heil microphone?

While the above procedure works for most rigs, it does
not seem to work for everyone. For the few that still
have gain problems, adding the Heil HMP microphone
pre-amp should work.

Some speculate that the differing mic gain requirements
are due to different versions of the IC-746, or simply
due to widely varying component tolerances. Nobody has
collected enough information yet to nail this issue down.

DO NOT use the HMP pre-amp unless you're sure you
need it. Too much gain will distort your transmitted
audio; with all the usual detriments (hard to copy,
splatter, etc...)

If you decide you need a pre-amp but want to build it
instead of buying it, then check out:

"Build a low cost Boost Microphone"
QST, Aug, 1989

along with the Icom specific mods available (DC blocking
capacitor, etc...) from KK5DR (Matt Erickson) at:

mailto:kk5dr@ev1.net

Another good QST article on microphone preamps is:

"Adapting the Astatic D-104 Microphone
for use with Modern Transceivers"
QST, Aug, 1999, p.34

a copy of which can be found at:

http://members.aol.com/ampmicro/

Q:3.3.6 What are the pin-outs on the microphone connector?

As listed on page 67 of the Instruction Manual:

1 - mic input
2 - +8V DC Output
3 - freq up/down
4 - Main readout squelch switch
5 - PTT
6 - GND (PTT)
7 - GND (MIC)
8 - AF Out (varies with [AF]) (center pin)

S:3.4. Keyers

Q:3.4.1 Can I hook up my straight key to the front "Elec Key" Jack?
Q:3.4.2 Can I connect my own Electronic Keyer to the IC-746?
Q:3.4.3 How do I wire up my paddles for use with the internal keyer?

Short Answer

Yes, virtually any type of key/keyer can be connected
to the IC-746 via either the front "Elec Key" jack
or the back key jack. However, the two jacks require
different wiring, and only the front jack will give
access to the internal electronic keyer.

The front "Elec Key" jack on the radio accepts a
3-conductor 1/4 inch stereo phone plug and can be wired
for use with anything. The back "key" jack accepts a
2-conductor 1/4 inch mono phone plug and can be wired
for use with either a straight key or an external keyer,
but not for the internal keyer.

See page 68 in the operator's manual for wiring details
and pages 23 and 27 for the programming details.

Long Answer

FOR A STAIGHT KEY OR EXTERNAL KEYER:

For a diagram on how to wire the stereo plug see page 68
of the Instruction Manual. For a straight Key or keyer,
wire only the tip and the Sleeve, and leave the ring
as No-Connect.

tip ring sleeve
oooo ====]]]]]]} ---------> 2 cond wire to key/keyer
(+) (nc) (-)

The back "key" jack is a mono 1/4 inch phone plug and
is easy to wire.

When using the front Jack, You also have to set the
radio to recognize that the ring is not used. To set
the radio, You do have to go to the "key", "set"

menu and tell it you will be using a straight key.
See Page 23 and page 27 in the operation manual.
While in CW mode press KEY(F4), then press SET(F5),
Press the down arrow(F2) until you reach the sixth menu
(KEYER TYPE), Use the Main tuning knob to set the type
of keyer to "Straight Key".

TO USE THE BUILT IN ELECTRONIC KEYER WITH PADDLES:

Wire the 3cond Stereo plug (use the front jack) so
that the "Dit" is the tip, the "Dash" is the ring and
the sleeve is common(-). (You can also wire up a "bug"
this way (without electronic keyer))

oooo ====]]]]]]} ---------> 3 cond wire to paddles
(dit) (dash) (-)

To set the radio to use the internal electronic keyer,
You do have to go to the "key", "set" menu and tell
it you will be using paddles. See Page 23 and page
27 in the operation manual. While in CW mode press
KEY(F4), then press SET(F5), Press the down arrow(F2)
until you reach the sixth menu (KEYER TYPE), Use the
Main tuning knob to set the type of keyer to "Elec Key".
(or "bug Key" to use the bug without electronic keyer)

Q:3.4.4 Can I use the internal and external keyers at the same time?

Sure ... you can have an iambic keyer plugged into
the front, and a straight or external electronic
keyer plugged into the back. You can then use either
interchangeably.

We don't yet know of anyone brave enough (let alone
capable) to actually use both keys SIMULTANEOUSLY.
Would such an person be a "two fisted" operator? 8)

==============================

S:3.5. Amplifiers

Q:3.5.1 How do I hook up an Icom IC-PW1 RF power amplifier?

The electrical connections are easy, just follow the
diagram at the top of page 79 in your instruction manual.

Then carefully read the instructions that came with
the IC-PW1 because they can be confusing.

Paraphrased (thanks to WA0SXV), the procedure is:

Turn everything on, set the 746 to full power,
and key up in RTTY.

Adjust the ALC pot on the back of the PW1 to
set the IC-PW1 ALC meter to the mid-scale point.

Power out on the amp should now read around 500w if
you are using 110 or 1000w if you are using 220vac.

No adjustments are needed on the 746 --- the PW-1
ALC should take care of that. When properly adjusted
the power output scale on the 746 will read something
around 35-50w.

Q:3.5.2 What if I hook up more than just an IC-PW1?

The PW-1 manual claims that you will not have to mess
with the CI-V addressing. That's not always true.
If the IC-PW1 is directly connected to the IC-746 (on
default CI-V address 54h and 56H respectively) with no
other devices, then the PW-1 auto-config routine senses
the IC-746 and everything works just fine.

If you introduce additional devices or alternative
interfaces (such as the DX4WIN logging software using
the "$10 Radio Shack" interface, talking to the IC-746
in CI-V address 56H) then the PW-1 can become confused
and stop talking to the IC-746.

One solution to the problem is to set both the IC-746
and DX4WIN for CI-V address 54H - the same as the PW-1.

(But, shouldn't each device have a distinct address??)

Q:3.5.3 How do I hook up a non-Icom RF power amplifier?

Start by examining the diagram at the bottom of page
79 in your instruction manual, but be careful, it can
mislead you into some expensive mistakes.

The ground and antenna connections are just as
straight forward as they appear, no problems there.

Do not hook the SEND output directly to your amplifier
as shown. You will need an external switching relay
or circuit to avoid overloading the internal SEND relay.

Not all amplifiers will have compatible ALC control
signals. The IC-746 ALC input runs from 0 to -4 Vdc.
W7DS designed a circuit to aid in automatic amplifier
band switching that may be useful to you. Check out the
"mods" section of this FAQ for more details.

Q:3.5.4 Do I really need an external amplifier switching relay?
Q:3.5.4 Where can I get an external switching relay?

Yes. If you hook up an external power amplifier, then
you will need an external amplifier switching relay or
circuit (see above). You have several to choose from:

Ameritron ARS 702
Ameritron ARB 704
MFJ ARB-702-I
MFJ ARB-704
W2ENY Amplifier Interface
Yaesu FRB-757

Also, the "soft key" modules from:

http://www.harbachelectronics.com/

are said to be useful.

Q:3.5.5 Why do I need an external amplifier switching relay?

Short Answer

Its far too easy to overload and damage the internal
switching relay, resulting in expensive and/or annoying
repairs. The external isolation relays are cheap
insurance for our rigs. Besides, even Icom technical
support reccomends them.

Long Answer

Given that the relay is prone to overload, the natural
question that arises is; just how much can it handle?
Things get both lengthy and muddy from this point
on, but since you're still reading, we'll press on.
Remember, you were warned.

This continues to be a process of discovery, so I'll
present what we know in that form.

Instruction Manual

Page 79 of the instruction manual says that the SEND
jack is rated for 16 Vdc at 2A. Some rigs have failed
while well within those specs. Others seem to survive
conditions far in excess of that rating. Obviously,
the ratings in the manual don't tell the full story.

Homebrew explanations (and solutions for) the problems
abound. Some talk about bypass capacitors while others
talk about suppresion diodes. Folks debate inductive

vs resistive loads and ratings. Surge currents and
hot switching usually get brought up, as well as AC
vs DC loading. For years, the topic keeps coming up,
but with no consensus or dependable solution; except
that using an isolation relay/circuit seems to prevent
any overloads.

Tech Support

So, many of us turned to technical support, but received
different answers at different times. For example,
in the icom@qth.net archives for January 2000, we
see that tech support told AB2BK that there was a
misprint in the manual. The true rating was 12 Vdc at
20mA and Icom reccomended an external isolation relay.
While that would explain the failures, it makes some of
the successes almost unbelievable. On the other hand,
the archives for February 2002 show that tech support
told N1JM that "The real scoop is UP TO 16V -OR- UP TO
2 amps.", again, reccomending an isolation relay.

While the techs did not agree upon the ratings, they
did agree upon using the external relay. Unfortunately,
none of the answers from tech support have adequately
explained the odd successes and failures.

Service Manual

All of this boils down to how much abuse relay RL1271 on
the Main board can take. The parts list on page 6-12
shows the relay as an OMR-109F. The obvious solution
is to look up the parts and see what they are rated for.
As of January, 2002, nobody had reveiled any spec sheets
for the relay.

Internet Search

Searching for "OMR-109" on the Internet did turn up a
curious tidbit. Icom has used the OMR-109 before, as the
SEND relay (RL2) in the IC-761. It had problems too.
There is a Service Bulliten (#24287-001A) entitled
"Larger relay for keying non-ICOM amplifiers" which
reccomends:

Replace RL 2 (currently labeled OMR 109)
on the PA Connector Board with a SY-12 relay
(ICOM P/N 921-04696). This relay is larger but
can be squeezed into place. Glue this relay
to the board with RTV.

Check out:

http://www.qsl.net/kd4sai/mods/icom/ic-761.txt
http://www89405.temp.w1.com/Modifications/B2502

More searching did turn up information for the SY-12-K relay, which lists a contact rating of 1 A @ 24 Vdc or 0.5 A @ 120 Vac (resistive). We can infer that the OMR-109 specs are most likely less than these.

http://www.fceu.fujitsu.com/pdf/sy.pdf

Unfortunately, we still do not have many answers.

Contact Parts Supplers

Finally, in February 2002, we found a listing for the OMR-109F (thanks to the kind folks at Omron Electronics for helping out). It doesn't say much, but does show a contact current rating of 1 A.

http://catalog.tycoelectronics.com/TE/bin/TE.Connect?C=14894&P=87296,91080,86600,76287,76437&M=PROP&N=1&LG=1&I=81&G=G

However, the above link did show who the manufacturer is. OMR relays are made by OEG. That finally led to some actual data sheets.

http://www.oeg.com.cn/pdf/14_OMR.pdf
http://www.qsl.net/kb9sss/IC-746/Parts/14_omr.pdf

Here are a few interesting pieces of info from the datasheet:

Max. Switched Voltage: AC: 120V.
DC: 60V.
Max. Switched Current: 1A (OMR-F)
0.5A (OMR-H).
Max. Switched Power: OMR-F: 50VA, 50W.
OMR-H: 10VA, 10W.
Max. Switching Rate: 300 ops./min. (no load).
30 ops./min. (rated load).
Operate time: 1.0 msec
Release Time: 0.5 msec
Expected Mech Life: 100 million operations (no load).
Expected Elec Life: 1,000,000 operations (rated load).

First we see that the listed current/votage ratings do not match anything we've seen or have been told before. Curious that. Why has Icom technical support given out at least TWO different sets of specs? One theory is that the relay specs we have are still not detailed enough.

It turns out that there are two ways to report maximum contact current. "Maximum Switched Current" is the maximum current at switching time; when the contacts are opening or closing. Once the relay is switched

on, the contact current may rise to as high as the "Maximum Carrying Current", but must reduce again prior to switching off. Thus, if the maximum carrying current is 2A, then the answer from Feb-2002 could make sense.

Switching Rates Explored

Closer examination of the maximum switching rates reveils a possible problem. Suppose, for example, I transmit at only 1 word per minute. We average 5 characters per word, 3 dit-dahs per character, and 2 switches per dit-dah. So, CW at 1 wpm will generate 30 relay operations per minute. That's the limit of what the relay can handle at full load. 10 wpm will generate 300 op/min, which is the no-load limit for the relay. 30-40 wpm (what my local CW contesters do) pushes us to about 1,000 op/min; which is well beyong the relay's rating. The max internal keyer speed of 67 wpm (as per ARRL review) would yield a brutal 2,010 op/sec.

This could account for the varying results encountered in the field. We'd all assumed till now that the problem was simply one of current or voltage overload. Now we can see that those operating QSK CW are overstressing the part, no matter what the load. Pushing the part that far beyond its operational limits would certainly make it more failure prone, which could explain some of the failures that have happened within the supposed current limitations.

Expected Lifetime?

Consider this: CW at 20 wpm would generate about 600 op/min, which would reach the expected mechanical life of the part after less than 3,000 hours of transmitting. But wait, if we apply that same rate to the expected electrical life, we get less than 30 hours of transmitting time.

In contrast, AM/FM/SSB/RTTY operation would likely require 200,000 to 2,000 hours (respectively) of operating time to hit either expected lifetime.

The Schematics

The schematic on page 11-4 of the Service Manual shows the SEND relay as an AHY103, not the OMR-109F listed in the Parts List on page 6-12.

(this is listed in the "Discrepancy" section of the FAQ)

Currently, we believe that the parts list is correct
and that the schematic is wrong. However, this might
help explain why Icom Tech Support has quoted different
specs at different times.

Summary

We have now identified MANY possible failure conditions
for the SEND relay.

* Too much voltage
* Too much current (switching or carrying)
* V/C spiking from inductive loading
* Accidental AC operation
* Exceeding operational rate
* Exceeding expected lifetime

Those are the reasons for using an external SEND relay.

Q:3.5.5 My SEND relay seems to be stuck, what do I do?

Ultimately, you'll have to replace it, either yourself
or via Icom service.

It is possible (battle field repair) to free the contacts
by tapping the relay till it frees; but YMMV! Actually,
it takes a fair amount od disassembly to access the relay,
and this solution is temporary at best.

Q:3.5.6 Can't I just use the ACC port to key my amp?

An Icom IC-PW1? Yes. Any other amp? Not directly.

First off, the signal from the ACC ports is from an
internal transistor and will only handle a miniscule
load. An external switching circuit will be required.

The SEND jack (RCA phono connector) on the back of the
rig is relay operated and is output only. However,
the HSEND and VSEND signals that are available from
ACC1-pin-3, ACC2-pin-3, ACC2-pin6, and MIC-pin-5 are
all bidirectional. These leads go to ground through a
transistor when the rig transmits. Actively grounding
these leads will put the radio in the transmit mode.

You'll almost certainly need a solid state isolation
circuit of some sort for this to work correctly.

Q:3.5.7 How do I build my own SEND relay isolation circuit/relay?

Your design will be dominated by several basic considerations: the voltage/load/polarity requirements of your amplifier, your choice of SEND jack keying or ACC port keying, and your choice of relay or solid state switching.

The send relay in the IC-746 (and others) closes 10 to 11 milliseconds before the start of the RF and opens about 7 milliseconds after the end of the RF. If you use a relay between the rig and the amp it had BETTER BE FAST. The relay in the amp needs to be closed before the start of the RF. This means the amp relay AND your intermediate relay together must be faster than 10 msec.

In general, solid-state systems tend to switch faster than mechanical systems. However, the relay based systems tend to be easier to design/build and are more versatile.

The line used in the ACC port for this is a bidirectional signal; it does both SEND and PTT functions. You'll need to account for that in your design.

One example of a relay based design, complete with suppressor diode, bypass capacitor, and limiting resistor can be found at:

http://www.qsl.net/kk5dr/IcomKeyInterface.html

Rumor has it that Matt will even build it for you; for a fee, of course. But then, you wouldn't have built your own, would you?

One example of a solid-state design (originally intended for a Kenwood, but easily adapted to an Icom) can be found at:

http://www.qsl.net/k0bx/amp.html

==========

S:4. IF Filters

Q:4.1 How many optional IF filters can I install into the IC-746?

There are two (2) slots for optional filters in the 9Mhz IF, and one (1) slot for an optional filter in the 455Khz IF.

Q:4.2 What optional IF filters are available for the IC-746?

Available filters for the 9Mhz IF include:

Icom FL-101 250 hz (CW narrow)
Icom FL-232 350 hz (RTTY, CW narrow)
Icom FL-100 500 hz (CW/RTTY narrow)
Icom FL-223 1.900 Khz (SSB narrow)
Icom FL-103 2.800 Khz (SSB wide)
Inrad 121 250 hz (CW)
Inrad 111 400 hz (CW)
Inrad 320 1.800 Khz (SSB)
Inrad 110 2.100 Khz (SSB)
Inrad 123 2.800 Khz (SSB wide)

Available filters for the 455Khz IF include:

Icom FL-53A 250 hz (CW narrow)
Icom FL-52A 500 hz (CW/RTTY narrow)
Icom FL-222 1.800 Khz (SSB narrow)
Icom FL-44A 2.400 Khz (SSB)
Icom FL-96 2.800 Khz (SSB wide)
Icom FL-257 3.300 Khz (SSB wide)
Inrad 306 125 hz (CW) (might not fit)
Inrad 122 250 hz (CW)
Inrad 116 400 hz (CW)
Inrad 322 1.800 Khz (SSB)
Inrad 314 2.100 Khz (SSB)
Inrad 109 2.400 Khz (SSB)
Inrad 124 2.800 Khz (SSB wide)

(The Inrad 306 is listed on their WWW site,
and is electrically compatible, but might
not fit in the available socket.)

The Icom crystal filters with an "A" suffix (FL-44A,
FL-52A, FL-53A) all have 6mm lower case heights than the
equivalent filters without the "A". They are electrically
identical to the taller filters. There is some question
as to whether there is enough clearance to install one
of the larger filters into the 746.

While not an optional filter, W2ENY has a kit to modify
the IC-746 by replacing either the stock 9Khz or 15Khz
wide internal filters with a 6Khz wide filter. See the
"mod" question of the FAQ for more details.

Q:4.3 Which optional IF filters should I buy?

Better to ask, "Why would I even need filters?".

Quite possibly, you'll won't need any optional
filters. Use the Twin PassBand Tuning (TPBT) to
dynamically adjust your IF bandwidth first. Properly
used, TPBT can give you nearly any bandwidth you want.
You may decide that you don't need any anything else.

There are over a thousand possible combinations of optional filters (1,539 at the last count). Most of them will make sense (i.e. be useful) to someone, somewhere. As it is a matter of style and situation, ultimately, the choice will be up to you.

We've broken up this issue into several questions, each targeting a more specific issue or problem. Short of writing a book, it is the only hope of providing any useful answers.

At the end of this section, we've listed some popular combinations. Don't use a filter combination just because it's popular. Optional filters could total $500 or more. Understand what and WHY you're buying to make sure you get your money's worth.

Q:4.4 What is an IF filter's "bandwidth"?
Q:4.5 What is an IF filter's "shape factor"?

Also called "passband", a filter's bandwidth is a measure of how wide a signal will pass thru the filter. For IF filters, this is typically measured as the span between the filter's -6db points. (Some folks measure bandwidth at the -3db points. Pay careful attention to the specifications when comparing filters)

"Shape factor" tries to represent steepness of the filter's attenuation curve. Typically defined as the ratio of the -60db passband to the -6db passband (bandwidth). The perfect shape factor of 1.0 is unobtainable. Shape factors of 2.0 or less are considered excellent.

This is one of those situations where a picture is worth a thousand words. A good look at the spectral response curve of a typical filter will make these terms clearer.

Inrad publishes basic performance curves of most of their filters on-line. An example of a typical curve is:

http://www.qth.com/INRAD/graphs/116.gif

AB4OJ has a complete set of passband curves for Icom's filters on his WWW site at:

http://www.qsl.net/ab4oj/icom/filters/filters.html

Several companies have good on-line treatments describing basic filter characteristics, complete with diagrams.

Corning Frequency Control has a very concise page styled in a glossary format at:

http://www.ofc.com/filters/definitions.html
(site not responding Jan-2002)

Vectron International also has a nice on-line treatment
of filter characteristics at:

http://www.vectron.com/products/xtal/filter.htm#definition

The folks at Piezo Technology Inc. describe filter
characteristics with attenuation curves.

http://www.piezotech.com/Technical_Information/techindex.htm

Q:4.6 Why do filter "bandwidth" or "shape factor" matter?

Narrower bandwidths reject more noise and improve
sensitivity. Wider bandwidths provide better fidelity.

Narrower bandwidths also reduce the number of
simultaneous signals the rig can "hear". This reduces
the AGC pumping action caused by nearby signals,
particularly important for CW and digital modes.

Smaller (tighter) shape factors reject more noise and
improve selectivity. Larger (wider) shape factors
generate fewer problems/complaints with fidelity or
ringing.

Q:4.7 What is considered to be a narrow filter?

In the context of (and for the purposes of) this
FAQ, a narrow filter is any filter that has a smaller
bandwidth than the stock 2.4Khz wide filters. However,
most texts will describe a filter as being narrow if
its bandwidth is smaller than that of the desired signal.

Q:4.8 What are narrow IF filters used for?

Usually, narrow filters are used to reject unwanted
signals or noise. The narrower the bandwidth, the less
noise there will be and the better the sensitivity.
You can lose part of the desired signal in the process,
but that may be preferable to the interference you're
trying to reject.

Q:4.9 Can an IF filter be too narrow?

Yes, an IF filter can be too narrow, but sometimes, that
can actually work to your advantage. We'll describe

only a few specific situations as examples.

When the IF filter's bandwidth is less than the bandwidth
of the desired signal, then part of the signal will be
rejected. This degrades the fidelity (quality) of the
received signal. In phone modes, the fidelity loss is
often mistakenly perceived or described by operators as
"distortion".

Fortunately, the inherent information redundancy of
human speech allows it to be readable even when an overly
narrow filter has rejected part of the desired signal.
That's where our advantage comes from.

One form of interference is when a nearby signal
overlaps your desired signal; as in an overcrowded band.
Rejecting the interfering signal necessarily rejects
part of the desired signal as well. Thus, the filter
is too narrow to allow all of the desired signal
to come through, but it is narrow enough to reject
the interference. While the result is "distorted" in
comparison to a clean signal, it is still more readable
than if you left the interference there.

Another example would involve CW or PSK31. The more
narrow the filter is, the less the interference and
noise. In these modes, it's almost impossible for a
filter to be narrow enough to actually reject part of
the desired signal, as in the previous phone example.
Instead, when a CW/PSK31 filter gets too narrow,
you start to experience the auditory equivalent of
tunnel vision. This can make it difficult to scan
around for signals.

One of the handy things about TPBT is that you can
narrow your effective IF filtering bandwidth at any time.

Q:4.10 What's the difference between IF filters from Inrad vs. Icom?

Inrad filters tend to have a superior shape factor to
Icom's (smaller numbers are better) as well as deeper
stopbands. They also tend to be cheaper.

When dealing with adjacent channel interference, the
filter shape (depth and slope of the attenuation curve)
is generally the prime factor. Inrad filters tend to
outperform the Icom filters for this application.

For example. The stock Icom filter in the 455Khz IF
has a -6db bandwidth of 2.4Khz and a -60db bandwidth of
about 5Khz. That gives it a shape factor of about 2.1

The comparable filter from Inrad has a shape factor of 1.6, a -6db bandwidth of 2.4Khz and a -60db bandwidth of 3.8Khz.

This all means that the Inrad filter has a steeper attenuation curve, resulting in better extraneous signal rejection and improved selectivity.

The Inrad filters tend to have greater ultimate attenuation than the Icom counterparts. Thus, Inrad filters tend to do a better job of adjacent signal rejection than Icom's filters.

However, while the 455Khz Inrad filters are drop-in replacements for the Icom counterparts, the 9Mhz filters are not. They need a short piece of coax and a connector to wired up to the filter first. The adapting connector plugs into the filter slot, thus alleviating any mods to the radio itself. Reported assembly times range from 1-4 hours per filter, depending upon the skill and care of the installer.

Finally, some claim that there is an insertion loss to the Inrad filters vs. the Icom filters. However, it's been demonstrated that dropping the noise level also drops the S-meter reading, possibly accounting for the reports. Bench tests do not show any insertion loss. Your ears may vary.

eHam.net has several user reviews on Inrad crystal filters at:

http://www.eham.net/reviews/detail/1499

Q:4.11 Which IF should I put an optional filter into?

Realistically, the performance differences between using filters in the 9Mhz IF vs. the 455Khz IF are fairly small and will probably go unnoticed in normal operation.

Most people make this decision based upon slot availability and filter cost.

Q:4.12 What's different between IF filters for 9Mhz vs. 455Khz?

The 455Khz IF filters tend to have superior performance characteristics while the 9Mhz IF filters tend to be less expensive.

Q:4.13 What are the 9Mhz IF filters best for?

When dealing with interference from nearby signals,
the sooner you reject the unwanted signals from your
RF chain, the better. So a single narrow IF filter
in a 9Mhz slot may outperform a single filter in a
455Khz slot.

Q:4.14 What are the 455Khz IF filters best for?

On the other hand, filters in the 455Khz IF seem to do
a better job of eliminating background noise, possibly
due to their superior performance characteristics.

Q:4.15 How do I get the best results from TPBT?

TPBT works best when the 9Mhz and 455Khz IF filters have
closely matching bandwidths. Non-matching bandwidths
will still work, but are less intuitive, which can
cause confusion.

There are several techniques to using TPBT. The one
described below has the virtue of simplicity.

Starting with both filters in their center, detented,
position (widest effective bandwidth), tune in your
desired signal as accurately as possible.

Grasping both IF shift knobs simultaneously, adjust for
the best sound. If you have a nearby, interfering
signal, then you'll probably have the best results
shifting your bandpass away from it.

Now, adjust just the 455Khz IF shift (the inner knob)
in the opposite direction for the best sound.

There's a whole document describing the theory and
mechanics behind TPBT at:

http://groups.yahoo.com/group/IC746/files/ic746_tpbt.txt

Q:4.16 How do I configure the IC-746 to use an optional filter?

After you've installed a filter, you need to tell
the radio about it. Using the SET menu, tell the radio
which filter you've installed (by Icom part number)
and which slot it is in. Then, hold in the FILTER
button for two seconds to bring up the filter selector.
Cycle through your available filters by mode and by
wide/narrow until everything is set up the way you want.

See the operator's manual for details.

Q:4.17 How do I configure the IC-746 to use a non-Icom filter?

You have to lie to the rig.

All of the IC-746 filter settings are on the basis of
Icom part numbers. (This is supposed to make things
easier for new operators.) Just tell the rig you've
installed the Icom crystal that most closely matches
the one you're actually using.

Lying to the rig does have a side effect.

The 746 cannot actually shift the IF filters' passbands.
Instead, the 746 shifts the LO frequencies of the 2nd
and 3rd IF stages to shift the signal back or forth,
aligning the edge of the desired signal with the computed
edge of the filter's passband.

Small lies generate small effects, like when you
tell the rig that a 2.1Khz wide filter is actually
1.9Khz wide, yielding a 100hz offset in the control.
Larger lies generate larger effects, like when you tell
the rig that a 400hz filter is actually 2.4 Khz wide,
yielding a 1,000hz offset in the PBT control.

Q:4.18 How do I use a CW filter in SSB mode to receive PSK31?

Icom took their ease of use one step further, and
programmed the rig to prevent the use of a CW filter
while in SSB mode; probably to prevent what they
considered to be a foolish user error. They didn't know
about PSK31 at that time. So again, you lie to the rig
during setup, telling it that the crystal is wider so
that the rig will allow you to select it for SSB use.

Q:4.19 Why is there only one optional 455Khz IF filter slot?

Nobody knows for sure, but the most popular speculation
is that it made the radio cheaper.

Q:4.20 Any tips on installing 9Mhz Inrad filters?

Neatness counts. Good soldering skills are a must.
Most of the hams who have installed one report that it
was more time consuming than they expected, but nothing
they couldn't handle.

KE5DC says, "Inrad also ships two socket pins that look like they are to be used for the filter. This doesn't work, as with the pins on the filter, the filter won't fit in between the case and the fan. Solder the leads etc. directly on the filter pins and then trim the pins to prevent grounding. My first attempt the pins had poked through the electrial tape and grounded to the case. It initially seemed like the filter was more effective than it should of been. Some playing around with the filter settings while listening to a decent signal narrowed down the problem to the 9MHz filter, and I just redid it and it worked."

Q:4.21 Where do I install a 2nd Inrad 9Mhz IF filter?

According to K7ZL, the place Inrad tells you to put the first filter is way over on one side in a little opening next to a fan, and that works fine. But he has found a second location. When you have the rig opened, if you go on a line from the 9 Mhz filters, then to the 455 Khz filters, and keep on going towards the front panel, you will see a square metal plate on the circuit board. He mounted his second filter on top of the metal plate, on its side, and it seems to work fine.

However, KE5DC reports that is is very difficult to prevent the cover from coming into contact with the filter. One could mistakingly force the cover closed; putting stress on the circuit board causing failure at some point in the future.

Q:4.22 What are some popular filter combinations?

"Popular" does not necessarily equal "best". Don't do something just because it's popular. Read the above material so that you can make an informed choice.

For example, one of the "best" optional filters for an IC-746 is a 2.4Khz wide crystal filter for the 455Khz IF (either the Icom FL-44A or the Inrad 109). The superior characteristics over the stock ceramic filter probably improves every one of the important receiver specs. However, the filter is unpopular. Most hams simply have trouble justifying $100-200 for a filter "they already have".

Given that caveat, here are some popular filter combinations you might want to ponder.

** None

** Single 500hz wide CW filter in either IF

** Dual 500hz wide CW filters, one in each IF

** Single narrow SSB filter in either IF

** Dual narrow SSB filters, one in either IF

** One wide CW and one narrow SSB filter at 9Mhz IF

Icom vs. Inrad? 455Khz vs. 9Mhz? Mostly a matter of preference (read above) and probably not as important as you think, otherwise, you need to read the more detailed material above.

==========

S:5. Computer Control

Q:5.1 How do I wire the IC-746 up for computer control?
Q:5.2 What cables do I need?
Q:5.3 What are CT-17, OPC-478, OPC-662 all about?

The IC-746 is computer controllable through a serial interface, but it is not RS-232. This is both good and bad. Bad, because you can't just plug it straight into your computer (wrong voltages, etc...). Good, because you can control four separate rigs with the same serial line. Therefore, to connect the IC-746 to a computer requires some interfacing. Icom made three: the CT-17, OPC-478, and OPC-662.

The CT-17 is the full boat. Versatile, it will allow 4 rigs to be controlled by a single RS-232 serial line. It's also the most expensive option and requires external power.

If all you want to do is connect up a single rig, then Icom's WWW site lists the OPC-662 remote PC control cable as the official part. If you can find it, then great. Most people can't. Instead, many hams have successfully used the OPC-478 PC cloning cable. It's less than half the cost of the CT-17. However, it is very short (1 ft ?) and will require a 1/8 inch stereo to mono plug adapter for use with the IC-746.

When you buy the RS-746 remote control software from ICOM, it comes with a single rig cable (OPC-662 or OPC-478?).

W2ENY sells a complete CT-17 clone and a single rig cable. They're both more complete package than Icom's, coming with cables and software resources on a CD-ROM. They're also cheaper. You can find out more at:

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

You could purchase the nearly universal rig interface,
the RigBlaster, from the folks at West Mountain Radio.
It does a lot more than simply computer control, and
is adaptable to other manufacturers (for a price).

http://www.westmountainradio.com/

There's really not that much circuitry in "simple"
interface cables, and many have homebrewed them for as
little as $10. Supposedly, the November 2000 issue
of QST has a suitable design (with feedback in the
January 2001 issue). On-line circuit diagrams based
on the QST article appear at:

http://www.ambersoft.com/Amateur_Radio/Icom_Interface.jpg

and

http://www.qsl.net/civ_commander/interface.jpg

KD6UU posted detailed schematics and instructions
on eham.net:

http://www.eham.net/articles/1588

and then wrote an excellent updated follow-up article at:

http://www.qsl.net/kd6uu/icomci.html

The actual design of the interface circuit is subject
to debate (as the above link will make clear). Several
alternative designs (along with a wealth of related
information) are available from DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

A few other sources for CT-17 circuit information are:

http://www.g3vgr.co.uk/civ.htm

http://www.seed-solutions.com/gregordy/Amateur%20Radio/Experimentation/CIVIn
terface.htm

You can also purchase many renditions of these hardware
interfaces from a variety of sources:

Universal RS232 Serial Interface for Icom/Yaesu

http://www.butel.nl/icomr2/icom11.html

K1NU ICOM Computer Control Interface

http://home.att.net/~k1nu/k1nu/Products/

RTS-01 Computer Interface cable for Icom HF Radios

http://rtsars.com/othercables_template.cfm

http://www.sarrio.com/sarrio/w1gee.html

Q:5.4 What is the control protocol for the IC-746?
Q:5.5 What is CI-V?

CI-V is the control protocol used by ICOM for remote PC control of their equipment.

This feature was originally used to enable a separate transmitter and receiver to act as a transceiver when interconnected via the CI-V bus (the receiver acts as a "slave" to the transmitter's QSY and mode-change reports) and for external amplifier control. It was only natural to adapt it to computer control.

The basics of the protocol are documented in the IC-746 Instruction Manual on pages 74-75. However, most people will prefer the documentation available from DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

or the documentation that comes shipped with W2ENY's control cables:

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

W7FG Vintage Manuals has listings in their catalog for both the CT-17 Level Converter and for the CI-V Communications Interface on their WWW site at:

http://www.w7fg.com/

Q:5.6 What is the CI-V address of the IC-746?

The CI-V address of the 746 is $56 (hexadecimal).

Q:5.7 What computer software is available?
Q:5.8 Where can I get computer software and upgrades?

There are several choices (compromises?) available. On one end of the spectrum, we have programs that replicate nearly all of the IC-746 controls on the computer. On the other end, there are programs that do computer assisted contact and contest logging.

There is a fairly comprehensive listing of CI-V
compatible software on DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

We'll mention some of the available software options
below. User reviews for some of the below software
can be found at:

http://www.eham.net/reviews/

and

http://www.qrz.com/search.pl?topic=reviews

** Icom RS-746 software

Icom SELLS a program called RS-746; buying it
is certainly the path of least resistance. It is
available through the usual retail channels. It comes
complete with both software and the necessary cabling
(OPC-662?). Many people describe it as a thing
of beauty. (Of course, beauty only runs skin deep.)

A description of the software can be found at:

http://www.icomamerica.com/amateur/hf/746soft.html

To quote ICOM's own support FAQ (circa May 2001):

Q: Where can I download the ICOM PC programming (or
cloning) software?

A: The ICOM programming software is not freeware,
and is not available for download on our Web site,
or anywhere else on the Internet. It must be
purchased either from an authorized Icom America
dealer, or direct from ICOM. RT Systems also
develops programming software for ICOM radios.

Ray (the product manager at the 2001 Hamvention) was
very firm on this issue. They take a dim view of the
pirated copies available on the internet.

Last word we know of (January 2001), Icom had no plans
to update/fix/enhance the RS-746 software.

** RT Systems software

OK, so Icom refers us to RT Systems at:

http://www.rtsars.com/

However, as of May 2001, RT Systems does not have a 746
control program. They told N8AVX (in February 2001)
that they had no plans to do so either.

** Kingsmith Software

Kingsmith Software is developing control software for the IC-746 (RATS IC-746), but as of May 2001, it wasn't available yet. More information is available at their WWW site at:

http://www.kingsmith-software.com/

** W2ENY

W2ENY ships a CD-ROM with lots of software and documentation along with the PC to rig interface cables he sells. Many of the packages listed here are also on his disk.

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

** RadioComm

Arachnophilia has several programs: RadioComm, IcomControl, and EasyTuner (among others). Check out the download section on their WWW site is at:

http://www.arachnoid.com/

** YP Log

Tony Field (VE6YP) makes a radio control and logging program called YPLOG that can control up to 4 rigs at a time and supports logging and contesting. His WWW site is at:

http://members.shaw.ca/ve6yp/

** TRX Manager

Some say that TRX Manager by F6DEX has more features than the original radios. More info can be found at:

http://www.trx-manager.com/

http://www.hosenose.com/trx-manager/

** XMLOG

The freeware logging software produced by W1ECT also talks directly to the IC-746. You can learn more at either the WWW site:

http://www.xmlog.com

or at the yahoo e-mail group site at:

http://groups.yahoo.com/group/xmlog

** TR Log

One of TR-Log's claims to fame is that it will run on
just about any PC. More details at:

http://www.qth.com/tr/

** CI-V Commander

A package that integrates well with the DxLab software
suite. More details at:

http://www.qsl.net/civ_commander/

** IRC

One of IRC's claim to fame is selectable skins.
You get to choose what you want your radio to look
like, be it IC-746, IC-706, or even a 007 spy watch.
More details at:

http://n9zle.tripod.com/

** ScanCat

Very extensive scanning support, including automatic
digital recording to your hard disk,

http://www.scancat.com/

** Radio Manager

An example of the virtue os simplicity, this shareware
from KC5IRJ does a lot with minimal resources.

http://www.interplaza.com/bensware/rmm32.htm
http://www.leader.it/shareware/info/00088.html

Q:5.9 Why doesn't computer software update freq when tuning the 746?

CIV Transceiver, when enabled, forces the radio to
report its frequency whenever you QSY, and to report its
mode whenever you change mode via a front panel button.
Make sure you've set this option in the IC-746 if your
software supports it.

With CIV Transceiver not enabled, rig control software
must periodically "poll" the radio to determine its
current frequency and mode. When using this mode,
make sure you have set your software's polling rate
accordingly.

==============================

S:6. Problems and Clarifications

Q:6.1 What's that funny rattling noise I hear when I first power on the rig?

Often, its the antenna tuning unit. The relays make
audible clicking/rattling sounds.

Q:6.2 What's that "click" I hear as I tune across certain frequencies?

The clicking noise you hear is very likely from the
relays for the rig's preselector (the service manual
calls them RF filters). At each boundary point, the rig
switches in a different RF filter. There are several:

0 - 1.6 Mhz low pass
1.6 - 2 Mhz band pass
2 - 4 Mhz band pass
4 - 8 Mhz band pass
8 - 11 Mhz band pass
11 - 15 Mhz band pass
15 - 22 Mhz band pass
22 - 30 Mhz band pass
30 - 50 Mhz band pass
50 - 54 Mhz band pass
54 - 60 Mhz band pass
108 - 174 Mhz band pass

Some mistakenly call this the antenna tuner (there is
even some component overlap), however, the preselector
and tuner serve different purposes and are each switched
in and out accordingly.

Q:6.3 Why doesn't the ALC meter work while adjusting the "mic gain"?

Despite what the manual says, the ALC meter only works
for SSB; not FM, CW, or RTTY. Nobody knows what (if
anything) the ALC reading means on the other modes.

Q:6.4 Why can't I program any numbers into the memory names,
the CW memory keyer, etc...?

Use the keypad to enter numbers. The dial only does
letters and punctuation.

Q:6.5 Why isn't my output power up at 100 watts?

One possibility is your DC supply voltage.

As shipped, the IC-746 really wants a full 13.8 Vdc to yield full output power. While the rig can operate at voltages as low as 11.5 Vdc, power starts dropping off as soon as you drop below 13.5 Vdc. Check the actual voltage your rig is receiving. You may need to adjust the voltage setting on your power supply.

If your rig isn't getting the voltage you think it should, then check for voltage drops along the power cord as well as across joints, fuses, and connectors. It's possible to lose as much as a half volt per connection. Solder joints and use high quality connectors where possible.

12 AWG wiring is the minimum, but 10 AWG is better.

If you absolutely can't get your voltage up (for example, total battery power), then you might consider adjusting the power settings for the RF PAs (there are 4 of them). However, trying to run a full 100w output at the reduced voltage will most likely degrade the quality of your transmitted signal (clipping, IMD, etc...). Most hams decide that the 1-2db gain doesn't justify the crumby signal.

One last possible remedy for the low voltage problem. You could get a DC-DC voltage converter. These are also called voltage boosters. Such a device accepts 12Vdc in and yields 13.8Vdc output. There's a price. First, they tend to only be 80-90% efficient, so a 20A draw by the IC-746 can translate to a 25-29 amp draw by the converter. Secondly, commercial units like the Newmar 12-12-35I DC-DC Converter can retail for more than $900.

There is a more afordable, ham designed and built, voltage booster system from W4RRY that should do the job. Check out:

http://www.fastq.com/~w4rry/

Q:6.6 The backlight in my LCD has stopped working. What's wrong?

Short Answer

Its probably one of the display driver transistors on the S-Logic board behind the display. It will have to be replaced.

There is reason to believe (but no proof) that setting the LCD brightness to HIGH may reduce the failure rate.

Long Answer

Unfortunately, this has become a problem for many
746 rigs, as evidenced by the data collected at:

http://groups.yahoo.com/group/IC746/database?method=reportRows&tbl=2

It's not the actual 'lamp' itself, but one of the
driver transistors. The lamp is fluorescent, and will
probably never wear out. Even if it did, the lamp isn't
available as a separate part; it's part of an assembly
you need to get from Icom.

Background into problem

There is a DC/AC converter driving the "lamp".
Check the S-Logic board for transistors Q301, Q302,
Q303, and Q304. Q302 is usually the culprit as it
is the voltage/current regulator for the dimmer
function. If you have a DC voltage on the collector
which is variable by the dimmer function on the radio,
then this transistor is probably OK. Q303 and Q304 are
the next most likely candidates. These 2 transistors
are in push-pull configuration to drive the X-former
(base is 180deg phase shift by the X-former)

Refer to pages 6-1, 9-1, 10-1, and 11-2 in the "Service
Manual" for more details.

Several folks at:

http://groups.yahoo.com/group/IC746

have successfully performed these repairs themselves.

OZ5ACI feels that the way the Q302 transistor is mounted
is a design flaw. Icom used the cooling fin of the
transistor as a soldering point, thus if it gets too
hot, the solder might melt. That slowly deteriorates
the soldering material resulting in a lost connection
and a cooked transistor. He has a feeling that future
cooked transistors can be prevented by simply unsoldering
the transistor cooling fin to lift it and lengthen the
center leg to establish connection at the cooling fins
soldering point.

AH6LE counters that if the transistor gets hot enough to
melt solder (300 degrees or so), then there are other
more serious problems. Most solid state devices won't
survive such temperatures, thus we're seeing the result,
not the cause.

The repair

One of the techs at MTS (a company that repairs Icom
gear) told K8UT that the repair is not difficult,
but he does not recommend it to those without

soldering/desoldering experience. The repair involves disemboweling the rig to get the S-logic board out; removing a metal shield that covers the transistors (about six solder connections); and then replacing the surface mount transistor. And, of course, reversing the whole process to put the rig back together again. The part itself is cheap - around $3.00 (Feb-2002).

If you're tempted to unsolder the control pots from the S-Logic board, stop and think; you're probably doing things the hard way. The affected transistors are on the side of the board facing the front of the radio. More extensive "mechanical" disassembly will eventually gain you access. Start by removing the front panel and work your way back. Page 7-2 of the Service Manual should help.

Icom UK told GW3WSU:

"The transistor (Q302) is available from stock but is a 2SB1201, it is only 47p + carr and vat, but unfortunately is below out <A3>10 minimum order charge. You do not have to unsolder the pots, remove the plastic front panel, then undo the pot fixing nuts from the metal sub-chassis, and it should all just come away. When you come to replace the transistor, its best to remove the screening can, this gives better access to the device. After replacement I would advise you to put a generous drop of heatsink compound accross the transistor and spead it over to the metal of the screening can, this will keep the transistor from getting too hot again in the future."

OZ5ACI used an "overkill" transistor from his junk box and had to cut a bit of the cooling fin to make it fit under the shield. The original transistor is not very tall and can be left at an angle so no cutting is needed (or wanted!). He says it's all fairly simple. The only trouble is that the front section of the 746 has to be taken totally apart and getting it back together with no dust behind the plastic screen is a pain. Get yourself a small can of workshop compressed air or CO2 if you can.

The part

So far, all reports from heftier transistor replacements have been positive.

From page 6-1 of the service manual, we can see that Q302 is a 2SB1201. At one point, the folks at MTS suggested a

2SB1202 as a replacement. Examining the specifications:

http://www.nedis.com/datasheets/datasemi/2SB/2SB1201.pdf
http://www.qsl.net/kb9sss/IC-746/Parts/2SB1201.pdf

http://www.nedis.com/datasheets/datasemi/2SB/2SB1202.pdf
http://www.qsl.net/kb9sss/IC-746/Parts/2SB1202.pdf

we can see that the suggested replacement is physically identical to the original part, but with 50% higher current capacity and 25% higher power disipation. It's switching time is about 10-20% longer (slower), but that should be unimportant for this application.

K8UT has successfully installed a 2SB1202 replacement.

Further Analysis & Possible Prevention

WA0KWK observes that we appear to have a DC-AC converter circuit with Q302 operating as a current carrying switch being turned off and on by Q301. (a light dimmer).

When the backlight is dim, the switch gets hotter because it is dissipating the current rather than the backlight. When the backlight gets brighter, more power is required by the display and the transistor has to sink less current by itself.

This leads to the counterintuitive deduction that brighter displays put less strain on the transistor than dimmer displays. Thus, the natural reaction (turning down the display brightness) actually makes the problem worse.

While we can't yet prove the above assertion, data compiled by WA0KWK from voluntary usage reports (brightness level, operation time, problems and repair, etc...) would seem to support the theory. The raw data is at:

http://groups.yahoo.com/group/IC746/database?method=reportRows&tbl=2

Of course if your 746 is still under warranty, you may want to consider going that route. Either way, you can contact Icom for the parts you need.

Q:6.7 Is there some way to get the Icom-746 to generate DTMF tones?

No. The IC-746 will not generate DTMF tones.

However, you have some options for generating DTMF tones yourself.

The good news is that Icom's compatibility table
shows that the HM-14 DTMF hand microphone will work
with the IC-746. It even comes with a handy switch to
enable/disable the UP/DN buttons. Remember, you have
to press the PTT switch to use the DTMF pad.

The bad news is that the HM-14 is a discontinued item,
so availability is limited. Also, as K9HFX discovered,
there are apparently two versions of the HM-14.
The version without the scan button enable/disable
switch did not work for him. More information is needed.

While not listed on Icom's compatibility charts as such,
VE2MHF reports that the HM-56A also works, even the
scan buttons and 14 DTMF memories. However, beware, as
VE4HAY reports that the DTMF pad on the HM-56 will also
work with the IC-746, but it's scan buttons will not.
We have to be careful of the 'exact' model numbers.

Icom confirms that the HM-118T will work with a
suitable wired adapter. There is also speculation
(but no confirmation) that an HM-95 microphone might
also work with a suitably wired adapter. If you succeed
with such an experiment, please let us know.

KC2CJW has successfully adapted an Alinco EMS-11
microphone for use on the IC-746. You'll need
two cable-mount 8-pin microphone connectors (one
female, one male), a couple of inches (maybe a foot)
of decent multi-conductor cable, a 470 ohm resistor,
and some soldering skills. Paul can provide pin-outs
upon request.

Another option is a portable tone dialer, such as one
that you could get at any Radio Shack. Just send the
tone sequence right through the microphone. Not all
such devices give access to the 'A' - 'D' tones, but
those tones don't get used much anyway.

Some have suggested wiring a DTMF pad into a microphone
cable, much like what you would do for a TNC. However,
as yet, nobody has shared any success stories.

Q:6.8 Why don't my "band edge beeps" match the US amateur bands?

Nobody knows what (if anything) the band edge beeps
correspond to.

Q:6.9 Can I transmit all the way out to the "band edge beeps"?

Yes, you can transmit all the way out to the beeps.
The IC-746, as shipped from the factory, can transmit
outside of the amateur radio bands. This has been
tested and confirmed on several rigs via dummy loads.

Q:6.10 Can I reprogram the "band edge beeps"?

No, there is no known way to reprogram the band edge
beeps. There are no fixes or planned updates from Icom
dealing with them.

Q:6.11 Do we know anything about the "band edge beeps"?

The band edge beeps generate a lot of discussion and
speculation. As of June, 2001, the band edge beeps on
all tested rigs correspond to:

1.8 - 2.0 MHz
3.4 - 4.1 MHz
6.9 - 7.5 MHz
9.9 - 10.5 MHz
13.9 - 14.5 MHz
17.9 - 18.5 MHz
20.9 - 21.5 MHz
24.4 - 25.1 MHz
28.0 - 30.0 MHz

If you know of an UNMODIFIED rig which differs from this,
then please let us know.

While nobody has figured out what the band edge beeps
correspond to, we have been able to rule out several
possibilities.

They do not correspond to the amateur radio frequencies
in Japan. For that matter, they do not correspond to
the ham allocations in any of the IARU regions.

They are not a combination of all available amateur
radio from around the world (i.e. a minimal superset).
They are much wider than that.

As wide as the band edge beeps are, they do not encompass
all of the MARS (Military Affiliated Radio Service)
or CAP (Civil Air Patrol) frequencies. To do that
still requires a "mod".

Any other ideas or info?

Q:6.12 How I reset back to factory default settings?

The procedure is listed on page 81 of the Instruction Manual.

While pushing in [F-INP] and [M-CL], push [POWER] to turn power ON.

Q:6.13 What "birdies" does the IC-746 have?

"Birdies" are spurious signals internal/inherent to the rig itself. They are normally generated by harmonics and/or mixing products of the internal oscillators (IF, VFO, display driver, CPU clock, etc...) that are picked up by one of the RF/IF stages of the rig.

Birdies are usually perceived as silent carriers on AM and FM and as steady tones on SSB and CW; sort of like someone tuning up on that frequency. Thus the perceived frequency of occurrence is affected by your preferred sidetone.

Often, local noise sources can be mistaken for birdies.

True birdies tend to be consistent from rig to rig.

The following frequencies have been submitted as possible birdies. There have not been enough correlated reports yet to confirm these as birdies. More information and reports are needed.

Q:6.14 How do I adjust the LCD display?

Page 66 of the Instruction Manual describes how to
change both the LCD contrast and the LCD backlight.

Push MENU to select M2. Push button to select LCD.
Push buttons to select lighting or contrast. Turn tuning
knob to adjust value.

Q:6.15 The Noise Blanker doesn't seem to do any good. What's wrong?

Probably nothing. Possibly your expectations.

Noise blankers are placed in the IF signal path, and
designed to gate/mute/attenuate out impulse noise.
Impulse noise is characterized by very sharp pulses
(steep rise time and short duration) such as ignition
spikes and certain types of power-line noise.

A good clue comes from the 746 service manual. The NB
adjustment procedure uses square wave pulses 30 mv high
and 1 msec long.

Therefore, a NB is not a panacea. Unlike an ANL or DSP,
a NB will have little or no effect upon static crashes
and/or white noise. Noise generated by power supplies,
fluorescent lights, and power inverters are generally
unaffected.

The NB works best when impulse noise is strong and the
signal is weak; like mobile in a vehicle.

Most hams report that the 746's NB is effective against
ignition noise, but not as effective as other rigs
they've owned.

Noise blankers are not all that sophisticated, and will
try to blank out anything that resembles an impulse;
even sharp voice peaks in an audio signal. Sometimes,
the NB will generate more noise than it removes.

The IC-746 NB is operating within the first IF, where
the passband is about 15 Khz wide. Any impulse like
component of a nearby strong signal may activate the
NB, again possibly doing more harm than good. Also,
strong nearby signals can fool the NB into fluttering
the receive audio.

The single best way to deal with impulse noise is
to eliminate it at the source. A NB (any NB) is a
compromise solution at best.

Q:6.16 How do I adjust or make the NB work better?

The NB is susceptible to both overload and cross
modulation from strong nearby signals. Often, turning
off the RF preamp or even turning on the attenuator
will improve the performance. Remember, the IC-746
has plenty of gain to spare.

The IC-746 Service Manual does have an adjustment
procedure for the NB on page 5-10. Icom Tech Support
provided W7GJ with a PDF copy of that page around
Jun-25-2001. That PDF file is now available from
several places.

http://www.bigskyspaces.com/w7gj/IC-746.pdf
http://groups.yahoo.com/group/IC746/files/IC-746-NB-Adjustment.pdf
http://www.qsl.net/kb9sss/IC-746/IC-746-NB-Adjustment.pdf

==========

S:7. Modifications

Q:7.1 What TX/RX "mods" are there for the IC-746?

"mod" is slang for "modification".

Most people who ask about modifying their radio are
looking for ways to make the IC-746 transmit or receive
additional non-amateur RF bands. The 746 already has
general receive coverage from 0.5 to 60.0Mhs, so no
"mod" there.

Modifying the IC-746 to transmit outside of the
amateur bands is generally considered to be illegal.
There are a few exceptions; like perhaps MARS/CAP,
transverter usage, changes/additions to ham bands,
etc..., but they can become controversial.

Icom will give you the correct mod for your IC-746 based
upon your serial number, providing you give them a copy
of your MARS license to prove eligibility. If you let
Icom make the mod for you (small fee plus shipping),
then the mod will not void your warranty

That said, MARS/CAP/TX/RX modifications for the IC-746
(and many other radios) can be found at:

http://www.mods.dk/

Another source for the TX/RX mods is QRZ.COM

http://www.qrz.com/download/mods-i-k/ic746.txt

Pay close attention, as there are two distinct mod
procedures which correspond to the differing placement
of the programming diodes on the PCB.

Q:7.2 What other "mods" are there for the IC-746?

Not all mods are about TX/RX frequencies. Here are
some of the others.

Note that none of the following modifications were
either provided by or approved by Icom. These all
come from fellow hams. Each "mod" exists for a reason,
but that reason may not apply to your circumstances.

Use at your own risk.

6Khz wide IF filters

W2ENY has devised a way to replace the stock 15KHz or
9MHz IF filters for AM work with 6KHz filters.

http://www.geocities.com/w2eny/icom/filter.htm

Safe 2m TX/RX Sequencing

AH6LE has modified his IC-746 to provide safe sequencing
for EME work.

http://www.ah6le.net/radiomods.html

Simple CAT interface

OK2WY has a "Simple CAT / programming interface for
ICOM RIGs". Rumor has it that he has also designed an
in-board step attenuator.

http://www.qsl.net/ok2wy/projects.htm

Seperate 2m TX/RX Antenna Lines

K7YVZ has proposed a mod to the VHF section to provide
separate transmitting and receiving antenna ports.
The details can be found at his WWW site:

http://www.qsl.net/k7yvz/746mod/

G4YTL describes the same thing at:

http://www.mods.dk/mods.php3?radio=icom&model=ic-746&selectid=1919#1919

Incresed MONITOR Volume

Unhappy with the volume level of the MONITOR, some
have tried placing a 4.7K resistor in parallel with
R1087 to raise the level. There are more details on
the www.mods.dk site at:

http://www.mods.dk/mods.php3?radio=icom&model=ic-746&selectid=2299

LCD Driver Transistor Replacement

Some folks have replaced the transistors that drive
the LCD backlight in an attempt to prevent overloading
and burnout. See the question devoted to LCD lamps
repairs for all the gorey details.

Poor Man's TCXO

N0UK (Chris) came up with a "poor man's" TCXO that
substantially reduces frequency drift, particularly
for 2m. He stuffed the 60 Mhz LO compartment with a few
"cotton wool balls". It doesn't eliminate drift
entirely, but the improvement is dramatic.

http://groups.yahoo.com/group/IC746/message/1959

Upgrading Stock Ceramic IF Filter to a Crystal Filter

The stock 455 Khz IF filter is a 2.4 Khz wide ceramic.
The PC board is drilled and traced for a full fledged
crystal filter (either from Icom or Inrad). In theory,
replacing the cheapo ceramic filter (Murata CFJ455K)
with a superior crystal filter should improve the rig's
performance.

One source of info claims that to do this mod requires
changing 2 resistors (R701 and R704) from 10K to 3.9K
to change the impedance seen by the filter from 2K to
about 1.2-1.5K. Most do not bother.

Q:7.4 Can I increase my RF power output beyond 100w?

Yes, but you probably shouldn't.

Technically, this more of an adjustmment than a "mod".
NI4L (and others) have outlined the alignment procedure
for increasing the RF power output above 100 watts.
The basis for these procedures can be found on page
5-4 of the Service Manual.

The procedure can be found on-line at:

http://www.mods.dk/
http://www.qrz.com/download/mods-i-k/ic746pwr.txt

After examining the circuitry in the schematics and
the specifications for the transistors involved,

http://www.qsl.net/kb9sss/Parts/2SC2694.pdf

most feel that raising the RF output power above
100w is a bad idea for a variety of reasons:

* You can exceed the power ratings on the output
transistors. Even if they don't blow out right away,
they can eventually due to the long term electrical
and thermal strain.

There's nothing to prevent you from frying the rig
except luck. There have been reports of output levels
as high as 180w; nearly 30% above the published
ratings.

* Pushing thw PA transistors closer to staturation
moves them toward non-linear operation; thus increasing
IMD and splatter. Much of the "extra" power can
end up as interference instead of in your signal.

Some IC-756 owners have found this out first hand,
that rig uses the same transistors in its RF PA.
Distortion started at about 110 watts.

* Increased heat disapation may be a problem. Nobody
has any design/spec data to tell how severe a thermal
gradient the heatsink and fan were designed for.
Even if the PA transistors could handle the heat,
other components might not.

* Increased power supply current could cause unexpected
problems. What happens to your external power supply
when you demand 30+ A on transmit? What about the
746's internal voltage regulators?

* Increasing the power by 50% more than doubles the
RF voltages within the internal ATU. Thus, making
it more prone to arcing and burnout.

* Differing part tolerances can surprise you. It's
much easier to compensate for component variations
when you stay well within their tolerances. Thus
some rigs may be more prone to the above problems
than others. Just because one ham's rig worked is
no guaranttee that your's will.

On the plus side, you might be able to increase your RF
output by as much as 1-2 dB.

That's a lot of potential problems for a meager gain. Most hams don't feel that it is worth it. If you really need more than 100w out, then you should probably consider an amplifier.

Q:7.5 I'm brave; what untested "mods" are there?

While several other "mods" have been discussed, to date, we don't know of anyone brave enough to try them.

Replacing PIN Diodes in the Demodulator

Likewise, it is speculated that the IC-746 has cheapo PIN diodes in the detector circuit. Again, in theory, replacing these with higher quality components (preferably matched) would improve performance, in particular, the 3rd order intercept point.

Removing the BCB Attenuator

A few folks have noticed that the IC-746 is less sensitive below 1.6Mhz. This appears to be due to an additional attenuator being switched in to protect the first RF amplifier from overload by comercial broadcast transmitters.

Some theorize that removing the extra attenuator (by simply bypassing it with a jumper) would improve the sensitivity. This involves R11 - R14 on the RF board (see p 11-5 of the Service Manual for the schematics).

Others point out that the atmospheric noise level on that band is too high to put any additional sensitivity to use.

Again, we don't know of anyone willing to admit to performing any of these modifications. If you perform one of these (or some other esoteric "mod"), then we'd love for you to share your results with the rest of us.

Q:7.6 What "external" mods are there for the IC-746?

These modifications are not made on the IC-746 internal circuitry, but are external interfaces of one sort or another.

Remote, Direct Frequency Entry Keypad

W2FS wrote an article for the Dec 99 QST entitled "A
Direct Frequency Entry Keypad for ICOM Transceivers".
The "Millennium QSYer" is based upon that design and
available from:

http://www.john.hansen.net/keypad.htm

Cordless Headset Microphone

Some hams have come up with a clever way to add a
cordless headset to their rig. Basically, you find
a cordless phone with a soundcard interface on it;
something designed to work with your PC as an internet
phone. (the IBM3330 900Mhz phone is a popular choice)
You hook up the phone to the transceiver like you would
a PC, and then use VOX to control TX/RX. Some have
had great success. W8WWV provides all the details at:

http://www.seed-solutions.com/gregordy/Amateur%20Radio/Experimentation/CLess
Phone.htm

Instead of a cordless phone, you could try using one
of the corless microphone headsets they sell for use
with computers.

Automatic Antenna/Amplifier Selection by Band

WD7S wrote an article for the May 2000 QST entitled

"Automatic Amplifier Selection for the ICOM IC-746,
IC-736 and IC-706MKII Transceivers".
Hewitt, Paul, WD7S May, 2000, QST, p.33

K6XX has similar circuitry described on his WWW site at:

http://www.k6xx.com/radio/icbsciv.html

Another copy is at:

http://krasnodar.online.ru/hamradio/w7ds.htm

EI7BA has some related projects on his site at:

http://www.iol.ie/~bravo/remote.htm

2m TX/RX Sequencer

G3SEK outlines a complete TX/RX sequencer for handling
more complicated transceiver/transverter/amplifier

hookups.

http://www.ifwtech.com/g3sek/dx-book/sequencer/

External Tuner Pulser

This is covered in the Antenna Section as well.

You can make the IC-746 think that there is an ATU
out there with a dummy plug like that available from
W2ENY at:

http://members.fortunecity.com/w2eny/tenatuner/

Operation is similar to that for the other tuners, but
transmission stops after an 8 second timeout instead of
by tuner acknowledgement. You can even build this
yourself based on the information at:

http://www.mods.dk/mods.php3?radio=icom&model=ic-706&selectid=1864

Don't mind that the info says its for the IC-706, all
Icom rigs from this era use the same circuitry/connector.

Unmuffling Icom Hand Mics

W0VD had problems with muffled audio, so he opened
up all of his Icom hand mics and removed the heavy
wad of felt that was in front of the mic elements.
He's receiving much better audio reports now.

The felt was probably there to prevent "popping" from
consonants like "B" or "P". So, beware.

==========

S:8. Misc...

Q:8.1 Are there different versions of the IC-746?

Yes, there are at least two distinct versions of
the IC-746.

While most of the indications are circumstantial,
one definitive piece of evidence are the two different
procedures for modifying the transmit/receive range.

Another definitive indication are the 2m differences
between the U.S., Japanese, and European versions.
In Japan, the IC-746 has different auto-repeater offsets

and is limited to only 50w RF output. In Europe, the IC-746 does not transmit above 146Mhz and has no auto-repeater offsets at all. There's also a version in Australia that is limited to 20/8 watts on 2m for FM/AM.

There are varying reports about the necessity of a microphone pre-amp when using Heil microphones, leading some to speculate upon differences in the microphone input circuitry. K9HFX was unable to generate DTMF with an HM-14 microphone; that might be related. There isn't enough information yet to be conclusive.

Some rigs seem to have problems with the transistors that drive the LCD backlight, some do not. This might be due to a circuitry change, or a difference in assembly. The jury is still out.

The only way the issue will be resolved conclusively is for someone to organize a data collection effort to sort out these details by serial number. So far, no one has volunteered.

Q:8.2 Can I operate 2m on reduced power?

Sure, just turn down the RF output power control (along the bottom front edge of the rig).

Too inconvenient? Then you could get inside and tweak the pots that control the RF PA settings. There are 4 of them for HF, 6M, 2M and AM (R989, R991, R993, and R990 respectively). Refer to your Service Manual for details.

Q:8.3 Where can I find plugs for the ACC connectors?

They are 7-pin DIN connectors (the old style AT keyboards used 5-pin Din). A couple (of many) possible sources are:

Digi-Key http://www.digikey.com/

BUX CommCo http://www.buxcommco.com/

Your local electronics store either have them or can get suitable substitutes. For example, most Radio Shacks have the 8-pin DINs in stock (#274-026). They are compatible after you remove the center pin.

Q:8.4 What are the pin-outs on the ACC-1 connector?

Page 72 of the Instruction Manual has the full scoop,
Here is a brief description.

1 RTTY (FSK) HIGH > 2.4 Vdc
Low < 0.8 Vdc < 2 ma output
current

2 GND ground

3 HSEND (HF PTT) ground to transmit on HF
goes to ground when transmitting
< 20 ma output current < 200
ma input current

4 MOD (audio in) 100 mV rms at 10,000 ohms

5 AF (audio out) 100-300 mV rms at 4,700 ohms

6 SQLS goes to GND when squelch opens
0.1 ma current

7 13.8V max 1A output current

8 ALC (0 to -4VDC yields 0 - 100W)

Q:8.5 What are the pin-outs on the ACC-2 connector?

Page 72 of the Instruction Manual has the full scoop,
Here is a brief description.

1 8V (< 10ma) (+/- 0.3V)

2 GND same as ACC-1 pin 2

3 HSEND (HF PTT) same as ACC-1 pin 3

4 BAND 0-8 Vdc depending upon band

5 ALC same as ACC-1 pin 8

6 VSEND (VHF PTT) ground to transmit on VHF
goes to ground when transmitting
< 20 ma output current < 200
ma input current

7 13.8V same as ACC-1 pin 7

Q:8.6 Does audio to pin 4 of ACC-1 trigger the VOX?

Pin 4 of ACC-1 does not trigger the VOX circuitry,
nor is the level of that input affected by the front
panel mic gain control.

Q:8.7 Where can I get replacement power connectors?

Short Answer

The connector you need is often called an "OEM-T"
connector. You can order Icom part number OPC-025A or
OPC-025D from any of the major ham equipment retailers
for a pre-wired cable.

Long Answer

Icom's cable compatibility chart lists the OPC-025A.
Most retailers sell the OPC-025D. Both apparently work.
The OPC-025A is rated for 20 amps, while the OPC-025D is
rated for 30 amps. Most hams prefer the beefier cables.

BUX CommCo sells equivalent cables/connectors that
are cheaper. You can find more info at:

http://www.buxcommco.com/

Rather than finding another Icom connector, many
folks put inexpensive connectors on the cables of
all their rigs and power sources. That way they can
use any rig with any supply no matter what brand.
Particularly handy for switching between mobile rigs.
Even Radio Shack has these, cheap.

One very popular connector is the Anderson PowerPole.

http://www.andersonpower.com/

which is readily available from either

http://www.dcpwr.com

http://www.powerwerx.com/

In fact, the PowerWerx folks have pre-wired, PowerPole to
OEM-T cables ranging from 1 to 10 feet long that are much
cheaper than the Icom part (less than half the cost).
You can always just snip off the PowerPole connector
if you don't want it.

Many clubs and organizations have been standardizing
on the PowerPole connectors for their high amperage
12VDC power. This makes all of their equipment
inter-compatible and interchangeable; a real plus in
an emergency. There's a good article on that subject at:

http://www.dcpwr.com/standard.html

Q:8.8 Where can I get replacement microphone connectors?

You've got plenty of sources:

Radio Shack - P/N 274-025 for the plug.

BUX CommCo at:

http://www.buxcommco.com/

The RF Connection at:

http://www.therfc.com/micconn.htm

Q:8.9 What is "Lo-Fi" SSB operation?
Q:8.10 What is "Hi-Fi" SSB operation?

Trick questions, as they are both the same.

They both refer to attempts to transmit/receive higher bandwidth/quality SSB signals. Basically, hams are trying to improve audio fidelity; they are striving for "Hi-Fi" quality. Few (if any) SSB rigs will ever achieve the 20 Khz bandwidth normally associated with "Hi-Fi", thus the "Lo-Fi" pun.

"Hi-Fi SSB" audio is a hot topic within ham radio. Everyone wants the best transmitted audio they can get, however, not everyone agrees upon what "best" is. The issues become even more heated once you add concerns over excessive bandwidth usage and splatter.

The characteristics/capabilities of the IC-746 allow this FAQ to take a neutral position in the debate.

Stock, the IC-746 has a SSB bandwidth of about 2.4 Khz. That bandwidth can be widened to as much as 3.4 Khz without deleterious effects (the FAQ describes how elsewhere). Pushing beyond that point requires more effort than most people are willing to invest.

A lot of "Hi-Fi" activity occurs on or about 14.178 Mhz.

Q:8.11 How does one improve the fidelity of a received signal?

Here is a checklist of several possible actions (not in any particular order).

* Assure precise tuning

* Use a high quality external speaker or headphones

* Try to run without pre-amps or with attenuator

* Reduce the RF gain (increase AF gain to compensate)

* Set TPBT to widest bandwidth

* Use wider IF filters

* Lower level of NR (counterclockwise - to the left)

* Turn off NR

* Turn off ANF

* Turn off NB

* Set AGC to SLOW

* Be sure input power is greater than or equal to 13.5 Vdc

* Use an external AF amp via the ACC ports.

* Equalize the AF output.

Q:8.12 How does one improve transmission fidelity?

Here is a checklist of several possible actions (not in any particular order).

* Using TCN, set the "SSB TX Tone" control to H. (SSB TX Tone affects all voice modes)

* Turn off COMP (compression).

* Use a higher quality microphone.

* Use microphone shock mountings and pop filters.

* Use external microphone equalization.

* Feed transmission audio directly via the ACC port, bypassing the microphone preamp.

* Lower RF output

* Adjust by monitoring signal on a second receiver.

Q:8.13 Can the IC-746 transmit at less than 5 watts?

Yes, with the help of some external circuitry.

The IC-746 isn't really designed for QRP operation (the 2+ amp draw on receive should prove that). The front panel control will only get you down to about 4-5 watts. However, you can apply a voltage to the external ALC input to get even lower. 0 to -4Vdc input yields 0 to 100 Watts output. One ham even uses a simple voltage divider/pot arrangement powered by 2 AA batteries.

K5UHF warns that there can be a minute moment of higher power output before the external ALC level kicks in.

Not normally a problem unless you're driving input
sensitive equipment; like transverters.

Q:8.14 How do I turn on both HF pre-amps at the same time?

You can't. Nor would you really want to.

HF preamp 1 is transistor based and yields about 10db
gain for the 1.8 - 54 Mhz range (160m to 6m bands).
HF preamp 2 is IC based (presumably an op-amp) and
yields about 16db gain for the 21 - 60 Mhz range (15m
thru 6m bands.

In practice, each HF preamp will work on any HF band.

The sensitivity of the IC-746 is so high that neither
of the HF preamps are rarely needed. You'll need the
attenuator more often than the preamps.

Q:8.15 How do I adjust the 746 for best AM performance?

The 746 performs well on AM for general communications.
However, many operators choose (and fall in love with)
AM for the sound. For this, the 746 can fall a little
short of expectations.

Start by improving your audio fidelity as described
elsewhere in the FAQ. Then, WU1T (Damon) suggests that
the trick is to back off the carrier level. You don't
want to run full carrier or full mic gain. He also
suggests turning compression off when using AM.

For general guidelines on setting up modern transceivers
for AM use, check out:

http://www.thebizlink.com/am/tech/htm/plastic.htm

Q:8.16 Is the IC-746 suitable for CAP and MARS operation?

For CAP (Civil Air Patrol) use, the IC-746 is compliant
only for HF, and then only if it has the CR-282 TXCO
option installed. Its not compliant on VHF at all.
See the following for more details:

http://www.ntc.cap.gov/comm/equipment/hf_equipment.cfm
http://www.ntc.cap.gov/comm/equipment/Lists.cfm

There's more information on this general topic at:

http://www.ntia.doc.gov/osmhome/redbook/redbook.html

While I don't have a link for it at the moment, I've
been told that MARS (Military Affiliated Radio Service)
must adhere to the same standards.

For both CAP and MARS, some grand fathering did occur,
however, that should have expired by now.

Q:8.17 How do I adjust the Noise Reduction (NR)?

The level of NR you want varies by mode and personal
preference. CW can generally tolerate more NR than SSB.
Most AM operators prefer little to none.

Fortunately, setting the correct level is very intuitive.

Start with the minimum, full counterclockwise setting
(7-8 oclock). Increase the level by turning clockwise;
the signal should sound better as you go. After a while,
the signal will start to sound worse; when that happens,
simply back off a bit.

So, essentially, you adjust back and forth untill you
"home in" onto the best setting. Most people end up
between 9-12 oclock for SSB and a little higher for CW.

As you eliminate noise, you alter the signal. In
phone modes, that's often interpreted as distortion.
At some point, the perceived distortion becomes greater
than the removed noise.

==========

Manual Errata

Know errors in the Instruction Manual, by page number.

P:2 (12) AF CONTROL references p.12, should be p.11

P:6 External speaker and remote interface jacks are swapped.

Page 6 has the external speaker and computer remote
connectors mislabeled (reversed). Looking at the rear
of the rig, the REMOTE jack is on the left and the
SPEAKER jack is on the right.

Page 68 shows the connections properly.

P:9 Incorrect page references in MENU descriptions at
the bottom of the page.

(4) TCN p.20 should be p.19
(7) KEY p.24 should be p.23
(8) RTY p.30 should be p.29
(9) TON p.35 should be p.34
(10) TSQ p.33 should be p.32

P:15 BAND EDGE BEEPS simply do not work as expected.

This is more a failing of the radio itself than it is
an error in the manual. For more info, refer to the
rest of the FAQ.

P:19 SSB TX Tone affects more than SSB

The "SSB TX Tone" setting affects the tonal quality of
AM and FM transmissions as well as SSB.

P:22 TRANSMIT button does not transmit on CW

This is more of a clarification than an error.
In every other mode (AM, SSB, FM, RTTY), the TRANSMIT
button actually "keys" the 746 to transmit a signal.
In CW mode, you have to activate the keyer as well.

Most operators use QSK when operating CW, which makes
the TRANSMIT button superfluous.

P:27 Only one bar for CW sidetone level, not two

In the CW -> KEY -> SET menu, there are 2 options that
control the CW sidetone: options 1 and 2. Option 1 sets
the sidetone level via the displayed bar. However,
option 2 is only an ON/OFF setting; there is no level
bar (contrary to what the manual shows).

P:32 No ALC adjustment for FM

In "FM Operation", under TRANSMITTING, section 5 it
states: Push TRANSMIT...and adjust the MIC GAIN so
that the ALC level in the ALC meter stays in the ALC
zone when speaking into the microphone.

The ALC meter is maxed out on any setting of the mike
gain and has no meaning or effect under FM.

ALC adjustments made in SSB carry over modes. Once you
get the audio drive level adjusted for proper SSB

modulation, then the audio drive level ends up being
right for all the other modes as well.

P:33 Incorrect filter diagram

The diagram at the top of the page is incorrect.
It shows only one stock filter (2.4 Khz wide) at the
9Mhz IF. There is a second, 15Khz wide, filter at that
point instead of the direct "through" connection shown.

P:42 reference for Noise reduction p.39, should be p.40

15Khz filter at 9Mhz IF?

P:46 No ALC adjustment for either AM

In the "Speech compressor" section, the ALC meter
doesn't appear to work on AM.

ALC adjustments made in SSB carry over modes. Once you
get the audio drive level adjusted for proper SSB
modulation, then the audio drive level ends up being
right for all the other modes as well.

P:46 Speech compressor

The "Speech compressor" instructions fail to make clear
the fact that both the MIC GAIN and COMP GAIN controls
will have to be adjusted for proper operation.

P:56 Enter numbers via keypad, not tuning dial

While the diagram specifically highlights the numeric
keypad on the radio; the instructions fail to mention
that numbers are entered via the keypad instead of the
tuning knob.

P:56 in 1st paragraph, the reference "for programming
scan edges" is p.56 but should be p.52.

P:68 The box describing the ALC JACK lists an input voltage
of "0-4 V". It should read "-4 to 0 Vdc".

P:70 In the box labeled "ANTENNA SWR" the manual states
(in part):

When the SWR is higher than approx. 2.0:1,
the transceiver's power drops to protect
the final transistors.

Actually, power starts cutting back much earlier than that;
somewhere between 1.7:1 and 1.3:1

P:77 The UT-102 Voice Synthesizer is installed in the
"bottom" of the transceiver, not the "top". Also,
the "shield cover" is not involved.

P:79 The "NOTE" for "CONNECTING A NON-ICOM AMPLIFIER",
should read

NOTE: The specifications for the SEND relay are
12 V DC at 20 ma (milli-amps). If this
level is exceeded, an external relay or
switching transistor must be used.

The 746 SEND line is designed to interface to a
solid-state amplifier trigger, like those used in Icom's
power amps. Many people have damaged their rigs by
trying to switch amplifiers with higher voltage/current
requirements.

==========

Manual Discrepancies

The "Service Manual" is supposed to be the best, final
word on the electronics within the IC-746. However,
the data it contains isn't always consistent. Here are
the known discrepancies.

Q302 on the S-Logic Board is a driver transistor for
the LCD backlight. It's listing varies depending upon
the reference within the Service Manual. We'd love to
hear which part is actually in your rig.

p. 6-1 Parts List 2SB1201-S-TL
p. 8-1 Semiconductor Information 2SB1201 S
p.10-1 Block Diagram 2SB1202
p.11-2 Voltage Diagram (schematic) 2SB1201

We believe the part is supposed to be a 2SB1201.

R1271 on the Main Board is a dry reed relay for
switching the SEND signal used to operate external RF
power amplifiers. It's listing varies depending upon
the reference within the Service Manual. We'd love to
hear which part is actually in your rig.

p. 6-12 Parts List OMR-109F
p.11-4 Voltage Diagram (schematic) AHY103

The Board Layout on page 9-7 clearly shows that the
R1271 has a completely different layout than either
R1111 or R1291, which are identified as AHY103 relays
in both the parts list and the schematics.

We believe the part is supposed to be an OMR-109F.

==========

Glossary

Here are short expansions of some of the more common
acronyms you'll encounter when reading about the IC-746.
This is not a dictionary, there are no definitions.

Contributors + Acknowledgements

There are two kinds of contributors to this FAQ: direct
and indirect.

Direct contributors have written entire passages that
have been incorporated nearly verbatim. Often, they are
specifically authoring something with the FAQ in mind.
Also, they are individuals who have been recruited to
review specific sections prior to distribution.

Indirect contributors have had their comments and input
collected and assimilated from public correspondence
on discussion and news groups, often without their
knowledge. They were simply answering questions,
offering advice, or otherwise just helping people out.

The coordinator has not tried to keep a record of who has
contributed what; the book-keeping would be horrendous.
All sources of information have been INVALUABLE and
are APPRECIATED. Listing contributors here is a
small token of thanks for their neighborly spirit and
generosity. The Coordinator apologies if anyone has

been missed.

Revision History

4.07.2002 More info on >100w power output.
4.06.2002 Added Q/A about setting NR level

3.27.2002 General cleanup - links, TOC, etc...
3.24.2002 More info on SEND relay isolation circuits
3.24.2002 Added SM reference for BCB ATT mod
3.19.2002 Added another magazine article

3.18.2002 Expanded info about >100w output alignment
3.17.2002 Started moving "mods" into a seperate section
3.16.2002 More updated info on LCD (Q302) failures
3.08.2002 Added Q/A on "long wire" antennas
3.06.2002 More info on amp/ant switching
3.04.2002 Added Q/A about internal/external SWR meters
3.04.2002 Updated Q/As on split TX/RX antennas
3.03.2002 Added more info on switching amps with ACC-1/2
3.02.2002 Added Service Manual Discrepancies
3.02.2002 Added "microphone mod"
3.01.2002 Yet more info on SEND relays

2.28.2002 Even more info on Q302 and LCD problems
2.27.2002 Added more info on voltage boosters
2.26.2002 Minor editing/formatting of "mods"
2.25.2002 More info on LCD driver repair
2.22.2002 More info on SEND relay limitations
2.21.2002 Added more info on Q302 and LCD burnout
2.21.2002 Added alternative prevention to LCD blow-out
2.21.2002 Added mod to MONITOR level.
2.21.2002 Updated Q/A on external tuner activation
2.20.2002 Added Q/A about internal ATU "gotchas"
2.19.2002 Updated Q/As on non-Icom amp hook-up
2.19.2002 Updated info on installing Inrad filters
2.18.2002 Added more TLAs to glossary
2.13.2002 Added Q/A about external ATUs
2.12.2002 Added citation for latest QST article
2.11.2002 Minor addition to NB question
2.10.2002 Updated some of the WWW links
2.08.2002 Added Q/A about keyless tuning in CW mode
2.07.2002 Updated mod Q/A to add tx/rx sequencer
2.06.2002 Minor addition to transmit fidelity Q/A
2.04.2002 Added Q/A internal/external SWR readings
2.04.2002 Added Q/A on measuring SWR in SSB
2.04.2002 Added Q/A about "popular" filter combos
2.03.2002 Added another IF filter passband link
2.03.2002 Added info on "A" suffix IF filters
2.02.2002 Updated Q/A's on microphones
2.02.2002 Added several Q/A's on amplifiers
2.01.2002 Reformatting of some manual errata
2.01.2002 Added M/E P:27 - CW sidetone level
2.01.2002 Added M/E P:19 - SSB TX Tone affects AM/FM

1.31.2002 Added Q/A about CAP/MARS compliance
1.31.2002 Added Q/A about future of FAQ
1.21.2002 Updated info on 746 NET

Yes, I've seen this page. What it doesn't show is the bandpass response further away from the center frequency. I would have expected it to drop on each side some number of dB per 10 MHz, i.e. look like a bell. What I saw was like multiple notches on each side of the tuned frequency, all the way to zero and all the way up to over 1GHz. I really didn't think there would be more than one pass-band frequency.

I may be obtaining my own spectrum analyzer so I can play with bandpass filters and see what really goes on.

Thanks.
Bob M.

4719. Help with Yaesu FT-8100

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-09 02:19:58 UTC
From: Marty Wallace <maw@hiwaay.net>
Message-ID: <ub4jto74g9n4cc@corp.supernews.com>
Source record: 44924

Hello all,

I was wondering if anyone out there could help me with a problem with my Yaesu FT-8100.

Currently when I try to transmit on the radio, the radio stops transmitting while the PTT button is still pressed and all the audio quits. If I turn the radio off for a while and back on, the audio comes back. As soon as I transmit again the problems returns.

I would greatly appreciate any help with this.

Thanks for reading,
Marty Wallace

I built a dual band j-pole, painted it black, and it's only noticable
amongst the trees when looking for it.
Total cost, less than 20 bucks. With parts to spare towards a second.

4722. Re: Best Freeware Terminal program for PK-232?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-09 02:58:36 UTC
From: SKooter <Corvette_Crazy@hotmail.com>
Message-ID: <RNss8.3315$eP4.1591958575@twister1.starband.net>
Source record: 44927

It's been my experience in years past when running a UHF/VHF/HF
Packet/Clover/Amtor BBS system that using audio interfaces and high
power tend to maximize problems. I much prefer to use the direct FSK
methods built into the IC-756PRO and use audio input only for voice.
The Pk-232 is connected and working just fine with no problems at
full legal power on any frequency. All I'm interested in is a bit of rag
chewing on digital modes without needing a cheat sheet to remember how
to change modes, I miss the convience of "brag tape" buffers for some
features, etc.
Don't really want to reinvent the wheel, just want to make it a bit
easier to turn.
Thanks

I have for sale an Icom IC706MKII with DSP.
This radio has had very little use and is
9.5 out of 10. With the radio I will include
The OPC-581 remote cable. I have the original
box, manual and mike. Reason for selling;
I have purchased the MKIIG model. Asking $675.

4725. Q: HTX-202 and 13.2v battery pack ?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-09 04:30:59 UTC
From: Mark Jeghers <mark@t4pNOSPAM.com>
Message-ID: <68us8.281203$2q2.25924723@bin4.nnrp.aus1.giganews.com>
Source record: 44930
Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment

I've heard that the Radio Shack HTX-202 has a
problem if a battery pack is used with a higher
voltage (e.g. 13.2v). It's said to produce an
error message in that case. Battery packs with
lower voltages are fine.

The external power connector takes 12v or more
just fine. I've also heard a fix (a small cap across
the battery connection) that is SAID to fix this
problem. I've heard no other corroberating info.

Anyone have experience with this? Is there a way
I can safely use a 13.2 battery pack?

Please reply to mark@t4x.com, but change the "x"
to a "p" in the above email (it is altered to stop
spammers). Thanks in advance.

For Sale Astron RS20M 20amp power supply, the one with meters.
Cosmetics are a 8 out of a 10. AES price $120, I'm asking $80 shipped
prepay or COD with payment being a Money Order or Cashiers Check only.

Also have a Motorola 7amp power supply for $30 with the same shipping
and payment conditons. Cosmetics are the same as the other one.

$1,000 starting price for a 22 year old kit. Too funny, but then again there's fool born every minute.

I saw an unbuilt HW-9 QRP rig that was at $750 the other day - maybe it went for more.

Hard to believe people through away that much money on this old, outdated stuff.

My first wife was like that. Lasted almost two years. Current one is an "Extra" herself; thinks we don't have near enough equipment or antennae.

Besides the J-pole, we make up 1/4 wave antennae using PL259 chassis jacks - the ones with a flange and four holes for mounting screws. Solder a 1/4 wave radial in each of the four holes and a fifth wire the same length where the center conductor of the coax would normally go. Bend the 4 radials down at about 45 degrees and the whole thing will sit on a table while you trim the center one for minimum SWR. You can also make it a bit long and bend a loop in it that allows you to hoist it up into a tree. That'll keep you on the air while you find a more understanding woman.

I am looking to buy a Drake AC-4 power supply so that I can put
my C-Line station on the air. I'd prefer one that's in decent
shape and doesn't need any repair work (simply because I have
too many projects already), but I will consider one that needs
fixin' up, as long as the transformer is good! I already have
a nice MS-4 speaker, so I'd rather buy just the p/s by itself.

Racal RA-17C-12 Communications Receiver for sale. This is the North American Version with American Tubes, S-Meter, More Audio Output, Coaxial Connectors, etc. It is all original. It is in very nice shape with top cover, copy of manual, and Racal Brochures. Stability is super with the Wadley Loop. See on page 329 of Osterman. It is listed as "scarce". This is one of the best receivers I have ever used. This one is in very nice shape and works exceptionally well. I need some room, so it is up for sale.
Price is $650 picked up in Abilene, Texas, or I can deliver it upon request to the Belton
hamfests coming up this weekend. Digital Pictures are available upon request.
Thanks, Charlie Hugg, K5MBX
Abilene, Texas

> first radio?

I'll add to what the first responder told you, and specifically address this question. The VX-1R is a cool little rig - I have two, and use them many times when I wouldn't carry a larger one. I've never owned the Q7A, so I can't give you a comparison.

Regarding buying this as a first radio, I would be skeptical. Yes, it can hit lots of repeaters - closeby. If you live in a large city or always hang around within a mile or so of your fav repeater, you'll do fine. I suspect, however, that you'll be further away often enough that you'll be noisy in the repeater and difficult copy for everyone else.

I'm the one who always touts the virtue of handhelds as a first radio, since they go anywhere, work anywhere, fit into an active life. Still, I'd get a 5W model first. Plus, if you're in a car a lot, you might even consider a mobile rig as a first.

Bottom line: talk to other hams in your area. Find out what power will work the repeaters YOU want to use, and where you can work them. Find out how far out you might want to be if you for example volunteer for SKYWARN or help out as radio operator for public service events.

have fun!

This thing was on ebay a few months ago -- I guess he didn't get enough money
the first time. Or maybe the buyer is reselling.

Bring money.

And I remember looking at these things in the Heath store in the late 70s.
Shoulda bought a few... :-(

Maybe I should buy a few Elecraft kits, and save them for old age :-)

4741. Antenna feedline connector/coax question.

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-09 19:38:06 UTC
From: pyr@dqc.takethisoff.org
Message-ID: <55r8lowtlt.fsf@dqc.org>
Source record: 44946

I have a J-pole antenna with a SO-239. I was using a RG58A/U coax with a BNC connector and went through some posts that say "USE A RG-8x" since its 50Ohms so the lose would be less on the line. come to think of it I seem to be doing it all wrong.
antenna(So-239)-----BNC RG58A coax BNC-----SO-239 on radio

now I have an amp that has SO-239's on the back to put in between the radio and the antenna. How do I fix this, any suggestions? should I keep doing the same except replace the RG58 with a RG8x and the original SO-239 to BNC setup?

BNC has more of a constant impedence unlike SO-239 so does it matter what connector is on the antenna or on the coax that matters?

Thanks.

This falls in the collector class. Just as people (collectors) will pay
more than the face value of money just because it is old.

746 hands down. Tx is better quality, rec is MUCH better. Esp on 6 N 2
Meters. look at the numbers in the qst tests it tells the tale. They you
have the group that says oh the digital filters are better Nope in my opinon
you the 746 selectivity and sensativity and esp the IMD numbers are much
better. Go with the 746 you wont be dissapointed. If you want 440 allmode
find a mono bander

Source record: 44855

Scrap the current feedline and use either 9913FX or LMR 400 (lower loss than RG-8 above 30 mhz). Put good PL-259's on each end - one to the antenna, the other to the amp output. Make a jumper from the same coax with Pl-259's on each end - one to the amp input, the other to your rig's antenna connector.

(Depending on how long the current feedline is, you may not even need an amp once you reduce the line losses... Assuming a low SWR, on 2 meters, with RG-58, you are loosing about 70% of your power - and your received signal strength - in 100 feet of feedline. Using 9913 you loose around 20%)

If you're using a j-pole, I'm guessing you're on 2 meters or above. At the vhf/uhf frequencies, 1/2-inch coax provides less signal loss than the smaller 1/4-inch coax, especially if your coax run is 50 feet or more. If the run is only a few feet, it doesn't matter much. If you go with the 1/2-inch coax, you'll definitely need the bigger pl-259 plugs and so-239 receptacles. Certainly, if your radio has a 239 receptacle, it will not accept a bnc plug.

4761. Rotors

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-10 03:25:35 UTC
From: Lou <tech@dp.net>
Message-ID: <a90bph$2aup$1@news.dp.net>
Source record: 44869

Out of curiosity, does anyone have a collection of service data, like Sams or factory, for the various models of rotors out there? IF so, e-mail me. Please do not refer me to any websites of companies that "repair" them. I've been that route already. I'm looking for info for personal use.

Looking at a Sams Index, they cover I'm going to say (not having counted) about 20 different rotors of CDE, ALLIANCE and Hy-Gain.

Even if you only have a few and not the whole collection, so long as it is complete service info, I'm interested.

Please e-mail me direct.

Thanks.

4762. Re: Antenna feedline connector/coax question.

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-10 03:42:47 UTC
From: pyr@dqc.takethisoff.com
Message-ID: <55wuvgqkw8.fsf@dqc.org>
Source record: 44865

Thanks for the fine feedback there.
Just to make sure I understand you correctly, will the PL-259 hook up
to the SO239 connectors on my antenna, amp and radio.
If I get a RG-8 for-instance about 3 ft to plug it to the amp from my
radio, having BNC connectors at the end and using a BNC-to-PL-259 be
good enough?

A quick search on radioshack.com didn't find any result for 9913FX
feed-line you mentioned. How can I get my hands on that.

"W6DKN" <w6dkn@qsl.net> writes:

Absolutely. You can't equate collector quality items with original
cost. A 1957 Chevrolet convertible cost about $3,500 when new. I
fully restored one now will set you back at least $50,000.

4765. Icom IC-255A questions

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-10 06:27:39 UTC
From: Ray Chason <johnnyreb.4@southland.smart.net.SPAMMEN.VERBOTEN>
Message-ID: <ub7mqrmeopm114@corp.supernews.com>
Source record: 44870

I went to the BARC hamfest in Timonium, MD and came away with an Icom IC-255A (and a license to use it ;-)). Naturally, the Correct Answer to my questions is "get the manual." That's in progress. All in good time.

Meanwhile, before I try keying any repeaters, I want to make sure I know what all the knobs and buttons on this radio do. In particular, I'd hate to QRM someone because I set the Tx at +600 when I thought it was -600 or vice versa. If anyone is familiar with this radio or the apparently-similar IC-255E, I'd appreciate whatever help you can give me:

* The radio can tune down to about 143.8 MHz and up to about 148.1 MHz -- outside the 2 meter band.

I've no intention of transmitting out of band; but why can this radio tune there?

* The radio has two VFOs, which may be tuned by selecting A or B on the VFO/Memory switch and then turning the large tuning knob. The VFO/Memory switch also has five positions numbered 1 through 5, which are memory registers.

Positions 1 and 2 are marked with a square around the digit. Is there anything special about them?

* The Function switch has five positions: DUP-R, DUP-N, SIM, A-B, and A/B. DUP-R and DUP-N must be the duplex positions, and SIM simplex. A-B and A/B apparently allow duplex operations with splits other than 600 kHz, where one VFO sets the Tx frequency and the other (perhaps always A, or perhaps the one set on the VFO/Memory switch) sets the Rx frequency. In A-B, turning the tuning knob changes both VFOs, so that the same offset is maintained, while in A/B, the current VFO is tuned and the other left unchanged. Switching this knob while listening has no audible effect, at least when VFO/Memory is set to A.

I have these questions about this switch:

o In A-B and A/B, which VFO is the Tx and which the Rx?

o Do DUP-R and DUP-N select the normal 600 kHz offset?

o If so, which of DUP-R and DUP-N puts the Tx at +600, and which at -600?

o If not, what do they select?

* There is a knob marked RIT. Web searches reveal this to be Receiver Incremental Tuning, used to zero in on a slightly off-frequency SSB signal. But this is an FM rig, and FM usually tunes with a PLL. Turning this knob has no audible effect, at least on a good signal.

What good is RIT on an FM rig?

* There are six buttons to the right of the tuning knob:

o A momentary switch marked M-W copies the current VFO A setting to the memory register, if any, selected on the VFO/Memory switch. There are five such registers.

o A momentary switch marked TONE ON, when pressed, keys the transmitter. Web searches reveal this button as sending a 1750 Hz tone. Apparently this is to key a repeater; but many repeaters use CTCSS these days.

The Correct Answer is of course "get CTCSS." All in good time. Will this button work with any significant number of repeaters? How many repeaters even require a tone, CTCSS or otherwise? I'm in Columbia, MD if that's any help.

o A push-on/push-off switch marked NOR and TS selects the tuning step size: 15 kHz for NOR (out) and 5 kHz for TS (in).

NOR is probably "Normal", but what does TS mean?

o A push-on/push-off switch marked Busy and Empty has uncertain purpose. The one effect I've observed from this switch is that if I tune an empty frequency, set the squelch just high enough to shut up the noise, and then switch from Busy to Empty, the receiver starts intermittently opening the squelch.

What does this button do?

o Two momentary switches marked S/S and S. STOP have no observable effect.

What do these two buttons do?

* Finally, web searches indicate that this rig can switch between 1 watt and 25 watts. Which control does this?

The rig appears to be in very good shape; its former owner was, I'm told, a silent key from Harford County. Too bad I didn't get his/her name or call. The only obvious problems are that the bottom cover is missing two screws and the Function knob is inclined to slide off the shaft. If someone can answer enough of these questions, then I'll see y'all on the 2 meter band.

Call? My call? :-) Of course. KB3HWB.

Hi, all:

Lately , I try to use CTCSS/DCS scanning with my FT-50R, but it mute audio output and scan tone quite slowly. That's why I curiously want to ask you and latest finding :

1. Kenwood F7/6 : Received signals are monitored through the speaker while scanning is in progress. CTCSS/DCS Freq. ID Scan does not scan the tone if a signal is not detected.

2. FT-50R: Audio output is muted while scanning is in progress. Tone scanning is quite faster while not no signals deteceted.

3. Do you know ICOM , Uniden , Radio Shack , AOR scanner or other rig scanning behave? Smarter or more stupid?

Miller, in Taiwan

Doing a little spring cleaning and have the following items to sell. Please respond to me directly via eMail (tvsjr@sprynet.com) as I do not regularly monitor these newsgroups...

A few items for sale before they go to eBay. Buyer pays shipping. I'm open to offers or package deals if interested.

1. SGC 231 tuner. 160m-6m. Perfect match to the 706s.
Brand new, never used. No box.
$450

2. Bendix/King KX99 NavCom handheld aviation radio
Very good battery
8+ condition
$250

3. Uniden BC235XLT handheld TrunkTracker (the original handheld model)
No manual
9 condition
$90

4. Icom U-16 commercial, field-programmable UHF handheld
No good batteries, will include several dead BP-8/CM-8 for recell purposes.
8 condition.
$100

5. Tektronix X/Y scope (Monitor 604)
Cap for fuse holder missing - can't test.
Unit was working several years ago.
Comes with cabling for an AEA PK-232.
8.5-9 condition.
Make offer.

6. Numerous old scanners. Make an offer on the whole lot.
Conditions are cosmetic only - radios are dead and dying electronically.
Bearcat 800XLT (8)
Bearcat 220 (7)
Bearcat 300 (7)
Regency MX7000 (10)
Regency Monitoradio (the 10 channel scanner with the red lights
across the front) with ext speaker (9)
Regency ACT-R1 single channel UHF receiver (9)

Regency TM-L1 Single channel VHF Low-band receiver
(46.38 Mhz I think) (8)
Radio Shack Patrolman Pro-77
(the one with 8 yellows scanning across the front)
(8)
Radio Shack Comp-100 Binary programmable 16 channel scanner
(8)
Radio Shack PRO-11 4 channel VHF-Hi scanner (8)
Hy-Scan 4 channel pocket scanner. Have 3.
EF Johnson 4 channel pocket scanner model 241-0352
with leather case! (9)

Buyer pays shipping on this. I'm open to offers or package deals, so feel
free to eMail me with them.

4773. Re: Icom IC-255A questions

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-10 15:22:13 UTC
From: derswede@aol.comspam.com
Message-ID: <20020410112213.11730.00004771@mb-mq.aol.com>
Source record: 44878

Ah, the IC255A. Had one years ago...no tones, so it sat in the garage hooked to a 12V batt and an old magmount on top of the cabinet. Good receiver and clear audio on transmit.

Think I still have a copy of the manual....plastic ringbound, I think. Its yours for $9 mailed via USPS in CONUS.

Think the -E model was the European model, the US model would do CAP/MARS (just above and below the ham bands, answering one of your questions). As for the splits, you are correct, as you can set non-standard splits (such as for the ISS) using the two VFOs. However, remember that the -255 will not remember memories when powered off and DC removed (i.e., no internal backup batt, thus the reason mine lived hooked up to the 12V batt).

Dup-R and Dup-N.....IF memory serves me (ok, where the ^&% is my cane!!!???) the -N is neg, the -R is positive (not sure.....but the manual is at the house). The RIT is useable if you've got a drifty xmitter on a repeater....not something you run into often today.

As for CTCSS....that is why I sold mine. However, you have two local repeaters listed w/o tones....147.135 (+) and 147.39 (+) (you're near Baltimore, right??). If you're closer to DC, lots of repeaters there and in VA. Get the ARRL repeater directory...or ask here...you'll get plenty of answers (and comments, HiHi).

Not a bad rig....there may be a CTCSS encoder for it (ah, yes....the manual will tell) and there are outboard solutions, too. Oh, yea....the power is selected via one of the knobs (volume or squelch)....it pulls out to select low power. Tug on the knobs...the one that has two positions is the power control. <<grin>>.

Hope this helps! Let me know if you can use the manual.

While we are at it, may I ask, was there ever a blank slide-on cover made or furnished for when you use the thing without the orgijnal battery pack? Sure like to have one, no mention in RatShack info.

4780. An optocoupled isolator for Yaesu CAT

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-10 20:43:23 UTC
From: Guidoted <guidotedDELETE@libero.it>
Message-ID: <Lt1t8.5110$vF6.162700@news2.tin.it>
Source record: 44885

Hello All,
I designed a simple optocoupled isolator for connecting the CAT
interface of our Yaesu FT1000MP MK5 to a PC.
The optocoupling avoids electrical and RF problems that you can have with a
simple RS232C cable in a contest environment.
If anyone is interested, go to http://www.hamlan.org/tech/tech.htm
Ciao and 73

I use Hyperterm with my PK232 and have for years. One side is VHF the other
HF.
It also use direct FSK for hf.

as for the commands: vhf on/off along with packet/pactor/baudot
will move you around enough.

I HATE those programs which seize control of your TNC in KISS mode -- leave
em in some strange state requireing taking the top off of the tnc and
remving the battery.

as for Brag tapes -- consider youself a much better operator by not using
them.

I don't know how many times I responded to a brag tape with "Your using a
long wire 3 element yagi and a Ringo? how bizzare -- try just the 3 ele
beam OM and see how that works by itself

Or better yet, the CQ that contains the entire QSO.

CQ CQ de Dudley in BFE, OHIO USING TS870S on KLM KT34A 10000WATTS at 09:23 Z
CQ CQ de Dudley in BFE, OHIO USING TS870S on KLM KT34A 10000WATTS at 09:23 Z
CQ CQ de Dudley in BFE, OHIO USING TS870S on KLM KT34A 10000WATTS at 09:23 Z
CQ CQ de Dudley in BFE, OHIO USING TS870S on KLM KT34A 10000WATTS at 09:23 Z
k

qsy thank you very much.

hyperterm is for the real ham LoL.

maybe we should start a thread on the worst Brag tape ever heard... bet
there are some stories there.

"SKooter" <Corvette_Crazy@hotmail.com> wrote in message
news:RNss8.3315$eP4.1591958575@twister1.starband.net...
It's been my experience in years past when running a UHF/VHF/HF
Packet/Clover/Amtor BBS system that using audio interfaces and high
power tend to maximize problems. I much prefer to use the direct FSK
methods built into the IC-756PRO and use audio input only for voice.
The Pk-232 is connected and working just fine with no problems at
full legal power on any frequency. All I'm interested in is a bit of rag
chewing on digital modes without needing a cheat sheet to remember how
to change modes, I miss the convience of "brag tape" buffers for some
features, etc.
Don't really want to reinvent the wheel, just want to make it a bit
easier to turn.
Thanks

The GRE-Radio Shack PRO-92and PRO-2067 do instanous CTCSS/DCS searches and displays them. Then they can be used
in the closed mode tagged to a frequency. The Uniden BC 780 XLT will also search for CTCSS/DCS tones but much
more slowly then us them with a given frequency. The ICOM IC R-2 will search slowly for CTCSS tones only and the R-2 can't handle /DOSE NOT DO the DCS tones. You need about twenty seconds to a minute of steady audio while scanning for tones to 'capture' a tone.If your not getting steady audio when scanning for a tone it can take a long
time to 'capture' or find a tone.

You might try the car stereo speaker knockouts or just parallel the outputs of the existing stereo if you have to. This is rarely a problem unless there are grounding issues, or you like to blast em'.

It is worth the effort to have your speakers separated so that you easily tell which one is active, or even to be able to focus on one out of the bunch. You can't do that if they are all on one speaker.

I'd strongly recommend getting smaller speakers, in order to keep the audio separate. If two or three radios get busy at the same time, I can assure you that you won't be able to understand anything. And as another posting said, physical separation is a good idea also. I speak from experience here, as a former police dispatcher, I routinely handled traffic on multiple radio channels. The Motorola console had a feature where we could select multiple radios and bring them all out the main speaker, but none of us tried to use the feature more than once.

Message-ID: <7b95ae11.0204102232.45a4fb2@posting.google.com>
Source record: 44803

Hi!

Sorry if this is innapropriate post for this group.. but I can find nothing on the net and wondered if someone could help out.

It's actually for a friend - he's writing a paper, and we are looking for differences in standards in the US and other countries.
I've found a lot on who uses what, as far as video/tv formats and power, what I cannot find is the "why" - the historical views...
On the video it's a little easier to guess, the technologies were just different and separately develped, hence all the PAL, NTSC and so on; but, why the voltage and frequecy differences and why 110 and 220(250) and not some other.. it seems that pretty much the wold uses these 2 variations, and it would be interesting to find how it came to be and why...

So.. if anyone could point me in the right direction - like alink, or more appropriate group, or whatever may help I'll be greatful.

Thx!

If it's not too much to ask, pls cc the answer to me via email at gregt@post.pl

Thank you all in advance.

I'll second that. I'll also add that when I had two
tri-banders (plus HF, CB, and scanner) in my car,
having different brands of speakers helped because
their different tonal qualities also told me which band
was active.

[snip]

Heh, heh... you impute far too much intelligence to these choices.

The main reasons "why" are:

1.) NIH - Not Invented Here. A mental condition that affects most
practicioners of technology.
2.) Techno-Politics. a.k.a. Electro-Politics - Essentially a non-tariff
barrier to International trade.
3.) Stupidity
4.) Serendipidy, or just plain...
5.) Ignorance.

BTW in the color video Standards arena you may have you heard that:

The Americans had an inter-company conflict and so made an inferior
compromise and chose NTSC - Never Twice the Same Color
Then the French chose SECAM - Something Essentially Contrary to the American
Method. And the Russians followed like Pavlov's dogs.
The British chose PAL - Because it gave "the best color picuture" but it
was/is the most expensive to implement.

I dislike in the extreme the "strobe" effect of 25 frame PAL television signals when used under fluorescent lighting.. :(That's one thing that the admittedly otherwise inferior NTSC 30 (29.97) frame system doesn't have)...

Hi Brenda:

Heh, heh... PAL flicker under flourescents, eh?

Well, I agree, but...

...since I am not a video professional, seldom use Rank video trans-coders, only get to Britain about every 5 years and my British friends don't have flourescent lights in their homes, the PAL "strobe" effect of which you speak is a somewhat minor annoynance.

Especially when compared to the extreme difference in prices between PAL and NTSC equipment.

Heh, heh...

It may be "the best", but I don't envy those poor suffering British TV consumers.

They not only pay more for the basic PAL TV equipment but they also have to pay a license tax/fee to the BBC *every year* as well.

Or one could go to Australia, which has the advantage of PAL without the
License fee, which was abolished years ago -- unless it's been
reinstated since I left.

Alan:

The land of Oz no longer has annual receiving set licenses?

Wow! Another former British colony finally breaks free of usurious overbearing government taxation.

Heh, heh...

As a former "colonial boy" and considering at least; Canada, Oz, and NZ, it seems that the main difference between the recently liberated colonists and those who chose revolutionary war as the method of liberation ["The Thirteen"] is that invariably the newly liberated colonists still prefer "taxation without representation".

LOL..

BTW, the strobe effect that I describe is with 50 Hz electric power to those fluorescent lights.. I got to observe the phenomenon firsthand while I was in Thailand last spring (220V 50Hz power, PAL TV system)

When I lived in Oz I was not merely allowed to vote for people to
represent me; I was required to do so.

To the best of my knowledge, no money collected by way of taxation in
Auatralia goes to Britain.

Source record: 44817

Hello,

I recently got an Icom ic-251E from an former amateur.

It does recieve FM, but no SSB/CW. I can see s-meter movement, but hear nothing not even on a used FM-freq in modes other than FM.

Anybody got an idea what is wrong?

The 220V power suply is not present. I use the 13.8V.
The radio works with that voltage.
There are two loose connectors inside. One is for the powersuply i assume. The other i don't know.

While transmitting (FM/SSB/CW) the red transmit light goes on, but i do not transmit any signal. The tx strengte is fully on. Anybody got an idea what is wrong?

For short: Who has more info about this radio. I'm looking for schema's, user manual pin-layout off mic, etc?

An URL is also welcome.

Thanks

Paul (The Netherlands)

Alan:

Oh yeah, well then...

Who pays for the Queen's and other Royal's trips to Oz?

Who pays to have the Queens likeness put on the coinage, paper money and stamps in Oz?

Is that not homage or tribute to a failed monarchy useful only to the Brits as PR and subsidized by former colonies?

Nothing against the Brits. They are great. Just wonder why should former colonies still subsidize, or emulate their archaic systems of taxation?

What?

Welcome to the land of the brave and the home of the free!

Best,

--Peter K1PO [A former colonial boy?]

Greg:

Smart-ass, heh, heh... May sound like it, but it is indeed real.

Electro-politics is serious business.

I've been personally involved in many national and international Standards groups. i.e. ANSI, ETSI, CEPT, ITU, IEEE, ISO, etc... and I can attest from first hand experience and participation in the development of several Standards that for the most part everyone attends and contributes to Standards associations and meetings just, "to ensure that no one else wins big!"

The leading cause of differences in Standards throughout the world is really due to the subverting efforts of indigenous manufacturers attempting to errect [non-tariff] barriers to international trade. Often international trade agreements [WTO, etc...] are thwarted by the development of differing Standards and the associated regulations/requirements to obtain local certification/attestation of imported equipment to meet those standards. This activity and regulation then protects local manufacturers from foreign goods and products.

Although there is some altruism involved, in general the "Standards Business" is messy and frought with self-interest.

Best,

--Peter K1PO

Thanks for read this message.
I have some trouble with my Kenwood tm-733:
After few minutes of normal tx operation the hf power
drop to zero, on both bands 2m and 70cm.
I have to wait 1/2h to operate again.
It's seem to be a temperature problem or
something like that.

If anyone had a same problem please send me some
infos.

73's Pascal F5LEN

The YSK-8100 consists of sub-panel mounting hardware, microphone connecting hardware and two 6-m interconnecting cables for the sub-panel. This allows the main body to be installed in the trunk, or anywhere else out of the way, while the sub-panel is mounted on the dashboard.

Here is a listing of the scanners that still remain to be sold by my friend Harold McNeal, in Orlando. He has reduced the price of these units. Some are Mil Comms capable, and some are Trunk Trackers. I know all of these to be in top condition. Terms of the sales are:
1. Price includes shipping to any CONUS address.
2. Price includes wall wart power supply or power cord.
3. Price includes manual and indoor antenna.
4. Radio will be shipped upon receipt of US Postal Money Order.
I prefer that you contact Harold directly, in Orlando, at 407/852-0693 (his NEW Number!) to arrange to mail him the payment. I will be glad to answer any questions if you want to contact me at 321/777-2018.

AL STERN Satellite Beach FL

ITEMS FOR SALE (UPDATE/PRICE REDUCTIONS)

Pro2053: RS#20-466. Trunk Tracker; Mfr:GRE. Base Model; 300 Ch; Moto I/II and EDACS Trunk Tracking; Scans trunk and conventional at same time; 25-54, 108-174, 216.0025-225, 406-512, 806-960, 1240-1300 MHz, no cell; Triple conversion; 25Cps Scan Speed; 50Cps Search; switchable 20db Attenuator; backlit 4-line LCD display; Alphanumeric frequency IDs; Weather Alert displays type of alert; Service searches for police/fire, Marine, CB, Ham, and Acft; Computer port; cloning capability; Faster than the 2067. (Orig Radio Shack price: $249.99)
Price: $160 shipped. 2 units for sale. (Prev unlisted)

Pro2052: RS#20-432. Trunk Tracker; Mfr:Uniden; Base Model; 1000ch; Moto I, II, I/II & EDACS Trunk Tracking; 29-54, 108-174, 179.75-512, 806-956, 1240-1300 MHz; 50Cps Scan; 100-300Cps Search; 5 Service Searches; Data skip; 50-Ch Search Skip; Weather Alert, RS-232C port for computer uploads/downloads. Monitors UHF Mil comms. (Orig Radio Shack price: $369.99, later $299.95)
Price: $160 shipped. 2 units for sale. (Prev price: $200)

Pro2050: RS#20-430. Trunk Tracker; Base Model; 300Ch; 10 Banks; 29-54, 108-174, 406-512, 806-956 MHz; 50Cps Scan Speed; 5 scan lists to store 50 talk group IDs in each bank (total 500); 300Cps Search; Data skip switch; 50 Search Skip lockouts. (Orig Radio Shack price: $299.99)
Price: $75 shipped. 1 units for sale. (Prev price: $100)

Pro2048: RS#20-417. Base Model; 200Ch; 10 Banks; Triple Conversion; 29-54, 108-174, 406-512, 806-956 MHz (no cell); 50Cps Scan; 300Cps Srch; 20 Search Skip lockouts; Data Skip switch; 10 priority channels. Wonderful speed; great for VHF air; scans all 200 channels in 4 seconds.
(Orig Radio Shack price: $229.99)
Price: $60 shipped. 1 unit for sale. (Prev price: $75) (A definite steal)

BC350A: Base/Mobile Model; Prepgmd Service Searches; 50-Ch programmable (20 Choice,20 Police,10 Fire); 11Band; 100Cps Search; LCD display; 29-54, 108-174, 406-512 MHz; 3W Audio. No radio is more sensitive in the VHF aircraft band. Price: $40 shipped. 2 units for sale. (Prev price: $60)

Hi Alan, I called TT about an ad in QRZ and ordered a VX-1R on my
credit card. The following week, the UPS man delivered a VX-150. I
called them and got their ususal nasty attiude and arranged to send
the 150 back to them (at my cost). Three weeks later, having received
no radio, I called TT and the disgruntled person at the other end said
they didn't have any VX-1Rs in stock. I told them to take the charge
off my credit card and forget it. I then called HRO and ordered the
radio from a nice friendly person. I received it 2 days later. It
isn't worth trying to save a couple of bucks to me to deal with TT,
particularly when it ends up costing me time and money in the process.

I've seen G5RV kits at just about every hamfest I've ever been to. That might be an easier way to get one. Then there's always the idea of building your own antenna ... no, I won't re-initiate the familiar ranting on that subject.

Message-ID: <ubdmvqc0tmin05@corp.supernews.com>
Source record: 44836

Still available... Best price and delivery is from:

http://www.pocosales.com/

The breaker you need is:

Part Number: T11-1-20.0A-01-10A-V
Handle/Style: Paddle/Toggle
Number of Poles: Single Pole
Configurations: Series Circuit Breaker
Frequency - Hz: DC-50/60HZ
Delay: Fast DC-50/60 Hz
Cross Calibration: DC Circuit
Voltage: 32DC
Rated Current: 20.0amps
Handle Color: Black
Outer Hardware: Black Knurled Nut
Indicator Plate: Vertical Mount
Terminal Adapters: No 6-32 Screw Terminal Adapters
VDE approval and CE compliant

This is a 20.0 amp, fast break, Snapak Magnetic breaker. You can sub "0" after T-11-""".... for an instant breaker if you wish. I've seen the Ten-Tec breaker both ways and Paul Clinton Service Manager at Ten-Tec said either is fine. You could also sub "11A" for 10A if you want silver knurled nut instead of black.

They are abt $9 each from Poco with a min order of $25. They will order one single for you if not in stock but it takes quite a while..... Aipax is slow on delivery as they require over a $500 min order from the wholesaler.

Regards,

Mike, W9WIS

I've tested many mics on a TS-850SAT and the original hand mic is excellent.
For a desk mic, the MC-60 was a clear winner. (I don't use the mic preamp)

For my voice, I use the hi-boost and no Speech Proceesor for ragchewing. Use
Speech processing and hi-boost (about 6dB) for busting the pileups and
General DXing.
Your Audio may vary!

I have for sale a JRC NRD-515 receiver in good operating and cosmetic condition. It has 6 kHz, 2.4 kHz, 1.8 kHz and 600 cps filters. Also included is an NVA-88 speaker, original NRD-515 instruction manual and a very nice photocopy of the NRD-515 service manual.

$900 + shipping from zip 76001.

4840. Setting Up Mobile Station

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-12 18:50:30 UTC
From: Jake <jake@hotmail.com>
Message-ID: <3cb72c77@news.microsoft.com>
Source record: 44844

I'm a new HAM and looking at setting up my first station...

My goal is to setup a complete mobile station, and looking for how others might have done what I'm describing. Here's my ideas:

I want the ability to use my HT to transpond with something more powerful and different bands for propagation. I also would like the ability to work HF from my HT. This is very similar to a repeater, so this can be thought of as a mobile repeater.

1. The base station will be my vehicle. This will provide increased power, better antennas, access to HF rig, etc.

2. The primary location will be on a HT. I will probably be in the backcountry, in the house, anywhere I want, and be able to communicate with more power, and different bands for a greater variety of propagation conditions.

Any ideas or resources would greatly be appreciated.

Thank you,

Jake

4842. FS or Trade list

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-12 21:18:22 UTC
From: gundoc <gundoc@iglou.com>
Message-ID: <yalt8.554$G72.522@sccrnsc01>
Source record: 44847

Please if you have questions or want to make a trade contact me off list at my e-mail address.
gundoc@iglou.com Some of these lists are not swap lists and only tolerate my post because it is only once a week. To the group owners thank you for letting me continue to post to the group. I have had requests to put spaces between
the radios on the list so I am going to try this on this list. Let me know what you think.
Dean

GE Portables

GE MPA VHF 146-162 full system keypad. Radio is as new and is almost perfect. The only flaw is the grip tape under the PTT button is peeling at the edges. Otherwise perfect. The next feature is, The radio is Key pad programmable. 16 channel scan and front face programmable. Has a like new battery and a good rapid charger. Also a belt clip. $500.00

GE MPA VHF Select 157 - 174 split. Nice radio 9 condition with battery and standard charger. I have it programmed down to 154 MHz with no trouble but will go no lower. $200.00

GE MPA UHF Scan 440 - 470 192 channel scan. Radio works great. A little paint wear on the edges but I have seen worse. With charger and battery. $225.00

GE MPD UHF select model 440-460. 48 channel alpha-Numeric display. programmed on the 440 ham band and works on the local repeaters and GMRS. With Battery and standard charger. Nice 8 - 8.5 radio. $100.00 Also have 1 in about a 7 condition $90.00

GE MPD select model 470.- 488 MHz. 48 channel Alpha-Numeric display. With battery and standard charger. 7-7.5 $90.00

GE MPD Scan UHF 440- 460. 48 channel Alpha-Numeric display. Also programmed on the hamband for testing. Works on the local repeaters and GMRS. with battery and standard charger. $125.00

GE MPD scan VHF 150.8 174. 48 channel Alpha-Numeric display. These look good and come with a battery and standard charger. 135.00 each.

MPD Voice Guard VHF system model with full keypad. 48 channel alpha display. with battery and standard charger. $140.00

GE PCS UHF 8 channel. I have this radio on the uhf ham band for testing and it works the local repeaters. with battery and charger. $95.00

GE MPS VHF Like new 10 channel. With new battery, new antenna, and a standard charger. $65.00

GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00

GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $200.00 all 3 radios.

GE Mobiles
.

GE Phoenix SX VHF 128 channel scan. No accessories. Has all 8 proms. $100.00

GE MVS UHF 16 channel scan. With Mic, Bracket, and power cord. $125.00

GE Mastr exec II VHF 75 watt mobile complete with accessories. $60.00 each

GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each

GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00

.GE Ranger VHF 150.-162 100 watt mobile. Complete with cable, Mic, speaker, and S550 control head. This is a great public safety mobile or can be tuned to the 2 meter ham band. $175.00

GE S990 head. Looks new but I have not had time to test this yet. $75.00

GE S550 head 16 channel looks good but not tested. $35.00

GE Mobile Vehicle Adapter For MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com) With mic, speaker, and power cable. $100.00

GE Accessories

GE TQ 2310 suitcase programmer. Has PLS, Phoenix, Delta s/sx, Voice Guard, MPS,
and Ranger. Printer is not working but I tried and it programs radios without the printer.
Has manual for the programmer and the computer. Has Phoenix cable and Voice guard cable. All in the original GE case tested and working. (except printer) $850.00

GE TQ2314 EPROM for Phoenix s/sx. This is the software prom for the suitcase programmer. If you have a suitcase programmer and do not have Phoenix this is for you $50.00

Mastr II control cable. $8.00 each

Mastr II head for mobile repeater operation. $5.00

Mastr II Mic. $5.00

Mastr II 8 channel tone boards. $5.00

Mobile Repeater cable for Mastr II. $10.00

Mobile Repeater cable for Delta or Ranger. $30.00. I have seen programming cables made from these.

GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2. If you buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.

GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each. I have 2 sets of EC/5C UHF icoms left

GE Delta cables. These are the downloading type used with the S820 heads. $40.00 each

Delta mounting plates. $10.00 each

Ranger mounting plate. $15.00

GE S-550 / 500 and others mounting brackets. $5.00 each

GE MPA, MPD, MTL public safety mic. $35.00 each

GE MPA, MPD, MTL standard Speaker mic. $25.00

GE PCS Universal Rapid charger. $35.00 each

GE MPA standard chargers. $20.00 each

GE MPA Rapid chargers. $30.00 each

GE MPI desk charger with wall transformer. $10.00

GE MPI Rack charger, 8 position. 25.00

GE MPI Mobile battery charger, Rare. $20.00

GE Battery discharger analyzer. For MPA, MPD batteries. Attaches to a rapid rack charger with a DB 15 cable and uses a MPD body to attach a battery to. Has LED readout in display area of MPD body to tell discharge rate. Another rare GE goodie. $45.00

GE shoulder strap like new, attaches where belt clip is. $15.00

GE Belt clips. $10.00 each

GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card and power supply / speaker. $300.00

Other Radios and Accessories

Motorola Saber III VHF 146-174 split. 120 channel Alpha-Numeric display with secure - net module. (no out of country sales) des I think. I have been using this all week and talking on the ham band to test this radio. Battery has lasted all week during drive time so it seems good. With rapid charger and big battery. $525.00 or trade for a VHF MRK II

Icom 3200 a Dual band ham radio. Has box and manual but no mounting bracket. Has tone squelch board installed. $225.00

Icom IC 24-at Dual band Portable. In good shape, Display has no scratches and only 1 small patch of the paint is peeled off of the back of this radio. With manual and wall charger. $175.00

Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland. $75.00

Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00

Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00

Motorola P200 VHF 136. - 150.8 high power. New battery and charger. 2 channel but can be made into a 6 channel easily. This would be a great ham radio. $115.00

Motorola Mitrek VHF high 110 watt drawer only. $50.00

Motorola Adapter for MX radios for the 1801 suitcase programmer. A and B prom. $175.00

Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all

Motorola UHF Convert-a-com Amp. 5 in 40 watts out. $45.00

EF Johnson 242-8600, 800 MHz LTR I have 4 of these. $25.00 each

EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00

Kenwood TK 940, 800 MHz dash mount radio. $100.00

Uniden SMS 825 ts, 800 MHz Dash mount radio. $75.00

Voter from IMTS phone system. 2 rec and 2 tx cards. $40.00

Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00

Antenna Specialists on glass 440 antenna. New old stock. $22.00

Antenna Specialists on glass 220 antenna. New old stock. $22.00

Consignment section

This area is for a few friends who like those other radios you know

"Motorola" They are good people and I will pass along any trades you may wish to make.

Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete. $425.00

Motorola Maratrac VHF 100 watt 16 channel head, Never mounted in a vehicle.$375.00

Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each

Motorola HT1000 Intrinsically safe, Re-cased looks new. 16 channel scan with charger. $425.00

Motorola P200 UHF high power. 6 channel. $150.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, anything you have extra. MPA or MPD portables what do you have and what do you want for them?
Johnson scorpion program cable. PSX200 UHF mobiles.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. If I think it may be bad I will not list it. I take cash, Postal Money Orders, Paypal, and checks but I hold them for up to two weeks to clear before I ship. If you have a question E-mail me.

Hi All,

I just got a hold of and watched the tape that originally came with all
of the early TS-870S transceivers. On the tape it shows the radio being computer
controlled. The radio on the computer monitor looks just like the 870. If I
remember correctly, this program was included with the early 870's. Does anyone
know where I can get a hold of this program ???

Thanks,

RON

I believe the Kenwood TS-2000 hf/vhf transceiver has the capability to be
controlled by a handi-talkie, but I'm not sure it is entirely legal. You might
check the specs at the Kenwood web site.

They still make and sell the AA battery pack, you have to order it from the catalogue but it, as well as the leather case and the 7.2 volt NiCad are still available from RS.

Hello, I bought a new CAT700 controller a few months ago and never hooked it to a repeater. It has the optional 16 channel DVR digital voice recorder. It has the Windows software programmer option. It is in the optional rack mount housing. It is like new! Paid $780. Will take $550. You can see it at their website:http://www.catauto.com/cat700.html
Thanks, Bob

Hi folks:
Can anyone tell me how to tighten the squelch so I can cut an S9
signal off? I've played with the setup screens (3 button mike thing)
and it doesn't seem to change. I'm probably doing something wrong.
Harry

Hello,
over 10 years ago there was a modification from DG8FZ to modify
the IC-271 for 12.5KHz steps in FM.

I didn't find anything on the web or packet-radio and would like
to ask if someone have this modification stored.
(DG8FZ also don't have it anymore)

regards
Bernd

Date: 2002-04-13 14:28:19 UTC
From: cprstn54zz@att.net
Message-ID: <3cb83d79.647804031@news-server.optonline.net>
Source record: 44770

On 8 Apr 2002 14:24:31 -0700, nm5k@wt.net (Mark Keith) wrote:
the
>most important thing to copy cw was probably the "F9" tuning setting.
>I'd turn the ALC to "on", and then go to F9 and set the tuning needle
>to be right in the middle of the two frequencies.

I think this is where I am messing up. Hamcom is listening for mark
and for space, just as it does in RTTY. So I set the mark for the
actual audio I am receiving during the CW emission. I set space
different frequency offsets below, starting with 170 Hz up to the max
of 999 Hz. I try to make sure there is some noise at the space
frequency setting so that the space "signal" will be detected.

When I press F9, I see the mark signal indicator but I never see the
space frequency indicator. My screen is an LCD, so it might be too
faint to see. I should be seeing some flickering all across the band
because the noise is everywhere.

You said you saw two indicators in F9. I see the lines for mark and
space in the spectrum (F7), but in F9 only the mark signal is
detected. If I set the needle any distance below th mark indicator, I
get nothing in the CW window.

Cush Craft Big Wheel Antenna for 2 meters

I used it for a while on 2 meters SSB and it worked great. And I went to a yagi.

The antenna could be overhauled some of the bolts are rusted. I have the spec sheet on the antenna with all the bolt sizes and assy diagram.

$40 plus shipping.

I will try to find a box for the antenna otherwise I will have to take it apart to ship.

Hi!
I'm really stuck here, and am not having a good time. I just picked
up a replacement antenna for my T7H, a Diamond RH77CA, and can't get it
to work. With the stock duck, I can hit this repeater with absolutely
no problem, I get the ct back from it and everything. I put on the
Diamond and transmit and hear nothing back from the repeater. It'll
receive fine, but won't transmit. Any ideas on what I can do to test
this a little better?

4887. Re: SB-200 help

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-14 00:31:23 UTC
From: Bill & Suzie Whatley <spud286@attbi.com>
Message-ID: <u54u8.14429$G72.11186@sccrnsc01>
Source record: 44792

You have not provided enough info on the operating conditions when this occurs but your description would seem to indicate a possible problem with V2 (the 572B tube).
The overheating is indicative of excessive current through the resistors.

Look for anything that would produce the high current in the circuit such as:
Grid problem internal to the 572B tube.
Leaky or shorted bypass cap (C14).
Problem with the bias supply including R1, R16, R18 or C19, C18.
Problem with ALC blocking cap C29.

The bias keeps the tubes in full cutoff until the amp is switched from standby to operational mode by shorting the ant relay line to ground. At that time the idle plate current should be around 90 mA.

With all power disconnected and caps discharged, measuring from pin 3 of each 572B to ground should be 5000 to 15000 ohms as stated in the assembly manual.

Hope this info might help....

4889. Re: Another 706 model on the way???

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-14 00:42:35 UTC
From: Alan Beagley <abeagley@optonline.net>
Message-ID: <3CB8D079.E7653EA@optonline.net>
Source record: 44794

Although I don't read Japanese as such (but can read the Chinese characters that are often used in writing Japanese), I didn't see anything about a new version of the IC-706 on the Icom Japan Web site -- but there were lower-power variants, the IC706IIGM and IC-706IIGS, probably for JA conditions.

It is of course possible that a new model will be announced in Japan at the same time as it is announced in the US.

What new features is the rumored new model alleged to have? If I knew that a new one was on the way, perhaps I would hold off buying a current one.

Is the current freebie RMK-706 offer a move to get rid of stock of the current model? Is that a big enough incentive for people to go out and spend big? I don't know.

I have learned that ICOM has cleared their warehouses of all remaining
706G's, which usually means an update is forthcoming.
I learned this from my dealer, even as I purchased my new PRO II.
Look for my "user" review on it, next weekend on my web site.

Brand new I'm sure it was a real gem. But I meant that it never ceases to amaze me what you will find for sale on eBay. I see things like this at the flea markets and don't even give it a second thought. If it looks repairable, then maybe I take it home. But some things just aren't worth the bother.

AES still lists the CTCSS board in their catalog. The part # is FTS-8.
They note that it's no longer manufactured and will only be available
until they run out of stock. I've found recently that other of the
major dealers still have some of the 736R modules and other options
available so it may be worth checking AES, HRO and a few others.

The listed price is $62.95

Hi

Thank you for reading this.

As the subject says I am looking for a PCPA-2 DRSI Card.
I do currently have one, but unfortunately no info on it.

I have the PCPA-1 card and I do not know the pinlayouts for it to drive
another TNC with.

Help for any of the above will be helpfull.

Thanks again.

I dont have the part number handy, but yes, I believe it's the TS-8 or a
similar part name (I'll look in the manual and get back to you) and I've
seen them both on ebay, and hear in the group. It's a simple plug in
procedure in the radio.

For lowest loss use the cable which has the largest overall diameter.

For durability use the cable whose jacket has been designed for outdoors
rain and sunshine and temperature variations.

But when all is said and done, the controlling factor may very well be the
SWR you run it at at the the highest frequency of interest.

Remember that a 1dB difference or change will not result in any noticeable
difference either by you or by the fellow at the other end.

Reg, G4FGQ

What never ceases to amaze me is that with all of the problems in the
world these days, how people can get so upset over one lousy eBay ad.

That ad and others like it will go away in 7 to 10 days. Our
worldwide problems won't.

I have a working HW-101 rig with the power supply, speaker and station console, SWR/power meter and various cables to connect it all together that I would like to clear out to make room. Reasonable cosmetic condition, no serious dings, dints or scratches. Dials and knobs okay. Looking for $200 USD plus reasonable shipping costs for the lot.

Contact me at

cbfengineer@telusplanet.net

for details.

Regards,

Curtis

Adding 220 wouldn't be much of a stretch. But I notice on the Icom 910H, the 10 watt 1.2 ghz module is an extra $500. I'd be surprised to see it as standard equipment on a 706.

I've never bothered with the space, etc on CW. Actually, I thought it
was fixed in that mode, but not sure. I only adjusted that for rtty.
>
> When I press F9, I see the mark signal indicator but I never see the

> get nothing in the CW window.

I can't run mine now as I don't have the modem hooked up, but I think
there is only one actual line. What it will do is "bounce" back and
forth according the what it hears. All you have to do is note the appx
middle of the two frequencies, and set the tuning indicator in the
middle. Have the AFC on. Once you set it in the middle, it should lock
with AFC. Yes, it will only print correctly if it's set in the middle
of the freq's, and too far off, it will drop out. It will work though.
Find a strong CW signal with good spacing as a test signal. Some
weaker signals in the noise won't copy too well no matter what you do.
It should work fairly well on rtty. Thats mainly what I used it for. I
always do CW manually. Also, use only an analog modem, IE: simple
op-amp modem, etc.."same as the sample circuit in the help/overview
section of the program" Don't use a digi interface. I don't think it
will work. MK

Swap / Exchange / Sell :

Trio TS520s with Matching DG-5 Digital Frequency Counter,
Perfect working order, good RX, Narrow CW filter and full O/P
on all bands.

Yaesu FL101 Transmitter, FR101s Receiver with Narrow CW filter with
matching Speaker.

Drake SW-4A Short Wave Receiver, mint condition fully working on all
bands, great little receiver.

SGC SG235 500w Auto ATU, NEW used twice only, comes with original manuals
and packing.

All equipment comes with manuals, is in full working order and good
condition.
Pictures can be seen at the URL below.

Open to "sensible" Offers ... OR will Swap / Exchange for the following :

Mint condition Yaesu FT840, preferably with narrow CW filter (500hz/250hz),
original mic, manual and box if possible.

Kenwood TS570DGE preferably with narrow CW filter (500hz/250hz),
original mic, manual and box if possible.

Please reply direct if interested.

If I had to guess what a new 706 would be like, I would use the 746
Pro for the model. I wouldn't expect any new bands, but 70 cm might
get a little more power. Will be interesting to see what develops. I
like my 706 MKIIg and 746 radios so much I really don't care what they
come out with.

Is it 8-pin DIN both ends? I found one to use with our (music) keyboard in the Mac department of my local MicroCenter store. Perhaps CompUseless and other computer stores that sell Mac stuff have them too. Even if the cable you need is not 8-pin both ends, you could buy one of those cables and splice it to whatever other cable or connector you need.

I use 9913 here for RX only. All I can say it don't try to move it. When
I actually build out my "shack" properly I'll most likely run 9913 to a
wall mounted block of some sort and use RG-58 or 8X from the block to
the rig.

Not likely that it would be a "10 watt" rig on 1.2Ghz, more likely a 1-5 watts output. Remember it is designed to be a "mini" mobile.

> SWR you run it at at the the highest frequency of interest.
>

As the frequency goes up, the run of coaxial cable represents a longer and longer distance in terms of wavelengths. It is entirely possible to get extremely misleading swr readings at high frequencies as a result.

For example, a run of lossy coax can show a nearly 1:1 swr reading, EVEN IF THE OPPOSITE END IS COMPLETELY OPEN! That is, lossy coax makes an excellent dummy load at VHF.

So I'd say exactly the opposite: Transmitter end swr readings are much more reliable at low frequencies than at high frequencies. If you want to know about your coax at VHF, you may want to actually try open circuiting it at the antenna and measuring the SWR at low power. There are published methods for figuring out the coaxial losses from such a measurement, but the rule of thumb is that the lower the swr, the worse is your coax.

My own experience as a VHF DXer indicates that most solid dielectric coaxial cables will deteriorate with age, and that you will need to replace the cable after several years of exposure to the weather. Fail to do that, and you will merely be warming the coax with your transmitter power.

I can still recall the time that I let some RG-8/U polyfoam coax get a little too weathered and a winter ice storm broke open the connection to my 2M yagis at the gamma match. The swr only went up to 1.6:1, and I spent some time warming the coax before I even realized that the connection to the antennas had been broken. And that was only 144 MHz. Higer frequencies get even touchier.

carl
i dont know the lay out of the SUV but i would suggest mounting it where the ashtray is unless you smoke then you can go with one of those radios that has a removable face plate then mount the radio under the seat and the faceplate on the dash somewhere
as for an antenna a 5/8 wave on a magmount on the roof would be good

4 Channel Digitizing Oscilloscope
This is a great scope! Although it's a mature product, it still sells for around $10,000 on the used equipment market.

FEATURES:
a.. 300 MHz analog bandwidth,
b.. 1 Gigasamples/sec,
c.. 4 channels,
d.. 8K record length,
e.. autosetup,
f.. automatic measurements,
g.. advanced logic and glitch trigger,
h.. sequential single-shot,
i.. mask generation,
j.. waveform compare,
k.. FFT, HP-IB.
This scope is recently calibrated, and in perfect working order. Easy to understand, easy to use, and reliable.

Don't miss out on this opportunity!

4941. Desktop mike for FT-736R

Does anyone know of a quality desktop mic for the 736r or of a way to modify the Yaesu MD-100A8X so it works with this radio.

One nice idea I saw with the Icom-207H (a dual-band rig) was to mount the head up by the mirror. They have a long cable available and the wire is easily hidden in the molding, plus the 207's head is quite small. There's a picture at http://www.qsl.net/w8kea. The guy who did it made a bracket so the molding screws could hold it in place.

I agree....If you want to make the antenna work the best just drill the dang hole like a real man and live with it...Magmounts suck and they damage the paint. And glass mount antennas are even worse...

IMHO YMMV

4945. FS: Kenwood TMV7-A and Comet GP-9 antenna

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-15 01:39:35 UTC
From: bearcat51@yahoo.com
Message-ID: <9014cad1.0204141739.3dfadee7@posting.google.com>
Source record: 44650

Hello, I have the following for sale:

1) Kenwood TMV7-A mobile dualband radio in mint condition, used only a couple of times. All accessories included. Here are some specs for the radio from Kenwood's web site:
-Large, reversible LCD display (the display is also removable for the security conscious)
-Dual receive on same band (f2), in simultaneous receive on VHF and UHF bands
-Up to 280 multi-function memory channels (180 channels when using Memory Name function)
-Memory name function. Identify each channel with up to 7 alphanumeric characters
-"Five-in-one" programmable memory (store five entire operating profiles)
-Guide Function
-CQ Review - check it out!
-PC programming software available for download (requires PG-4S cable)
-144 MHz/440 MHz
-Optional VS-3 voice synthesizer
-Optional remote head kits
Power is 5 (low), 10 (medium), and 35 on UHF (high) or 50 on VHF (high).
If you want more info on the radio, here is a link to Kenwood's web site:
http://www.kenwood.net/products/index.cfm?AMA=open&ama_mob=open&radio=TM-V7A&selection=Amateur&ID=25
Kenwood has a suggested retail price of $449.95 but I am asking $340, which includes S/H via UPS anywhere in the continental US.

2) Coment GP-9 dualband base station antenna. This antenna has NEVER been used. Here are some specs from Comet's web site:
-It has a max power input of 200W, 8.5 db gain (146 MHz), 11.9 db gain (446 MHz), and a VSWR of 1.5:1 or less.
-It has an SO-239 or Female N-type connector.
-The antenna comes in 3 heavy duty fiberglass sections and is about 18' long total.
Here is a link to Comet's web site for more info:
http://www.cometantenna.com/base.html
Asking $140 for the antenna, which includes S/H via UPS anywhere in the continental US.

If interested in any of the two items or if you have questions, please email me at bearcat51@yahoo.com. The prices above are negotiable.
Thanks!

Source record: 44657

Motorola MCS2000 Model 2 - FLASHport - 806-870 MHz - NO RESERVE!

You are bidding on ONE Motorola MCS 2000, Model 2, FLASHport, 800 MHz, 35Watt, Privacy Plus Radio. This radio has the H38/G51 (Smartzone Operation) Flashcode installed. It operates in the 806-870 MHz range on Type I, II, IIi Systems and in conventional modes. It is capable of up to 160 Talkgroups and Conventional Channels combined -- on up to 20 Systems. The model number is M01UJM6PW6AN. Included in this auction is a palm mic, speaker adapter, and speaker (with speaker bracket). No other cables or parts are offered. This unit works great. I currently have it programmed on City Police, but will have to blank it for security reasons. There are NO scratches in the display. This unit is a 9.99 out of 10. It has small scratches near the rear of the unit where the unit was opened and checked out by an authorized MSS. This model is a dash mount, but it is capable of being converted to a remote mount with the purchase of a remote mount kit (about $160 new). Please refer to Motorola's web site for more details and features of this radio. This model lists for $2500 new and possibly more for the H38/G51 Flash options.

What's this attack about? No, wait, I am sure I don't want to know.

In would suggest start your own newsgroup where you can post as many attacks as you want. Maybe you might want to post some reasons for your attacks as well, lest we think you are also an "all-around f*ckwit" for attacking people unnecessarily.

Source record: 44661

Well, I found one problem: I was using 3.0 rather than 3.1 and it wasn't letting me set the RX speed manually. The automatic setting was going so high that every keystroke was seen as a letter (hence the t's and e's).

I loaded 3.1 and things improved a little. It displays more information and lets you set the RX speed manually. Also you can tune so that in CW display (F2) a little dot moves up (mark) and down (space) in keeping with Hamcom's interpretation of the audio. When you tune just right, Hamcom gets some of the letters right. It is overly sensitive (yet not discriminating) and -- overall -- not too helpful. I would estimate it at maybe 5% of a human -- at best.

Anonymous coward and all-around fuckwit
"Stagger Lee" <SLee@houston-hunks.com>
revealed what a hypocrite he is and ironically admits he has no credibility
in message
<3C36FDCC.76EC185D@houston-hunks.com> :

"Therefore, I find your story difficult to believe. Your own anonymous
status makes the story even less credible."

And Faggot Lee is less than hospitable when he blathered:

Faggot Lee posts the following slobber, not realizing his own whining and
netKKKoping past in <3C8BA6A5.19219DD3@houston-hunks.com>:
"You don't like it? I suggest that you use your OE news filters, or simply
skip the thread. No one is forcing you to read it, and you sure as hell
aren't going to get any of the participants to stop."

And it looks like Faggot Lee started the crossposting.

I don't deal with the sub-compacts much, I have an Excursion. ;^) Anyway, on the bottom of the dash is a small indentation. Just below the pocket in the dash to the right of the steering wheel. Brake controllers are often mounted there. I mounted my radio there and mounted the brake controller to another bracket connected to the radio bracket. I then use a 2m magmount that looks like a cell phone antenna. I can hit all the repeaters I need in about a 50 mile radius. The newer magmounts have a layer of mylar over the magnet, so it does not damage the vehicle. My has worked quite well, and I enjoy it quite a bit. Good luck.

ONE, NEW, ANTENEX brand, Phantom model, 3db gain, 450-470 MHz, "Transit" style, UHF Antenna. Antenex part number TRA4503. It is NEW in the bag. This antenna mounts to a standard MOTOROLA style mount (NOT INCLUDED IN THIS AUCTION). I have been using this style antenna for my personal equipment and I am very happy with the results. Great for low-profile or unmarked vehicles!

I used 9913, too. It's good stuff but don't put it where it'll get stepped on or run over or twisted around a lot. Keep bends on a wide radius.

Also, be aware that with 100 feet you will have losses, especially at UHF. I put an 80-foot piece of brand-new 9913 on a 2-meter antenna once. Before I put it up, I put a Bird wattmeter on the transmitter and read 100 watts output. Put it at the other end of the cable and read 50 watts. You can imagine what it might have been at UHF. I seriously doubt LMR400 would do better.

The only better choice is hardline and the expense of cable and connectors is prohibitive for most hams.

Hi, Michael...

I bought a roll of 500 feet of the 9913 flex. The insulation around the center wire is some kind of foam but "solid" not like the "bead" of insulation that coils around the center conductor in 9913 itself. Also, when I was separating the shield and center wire to connect it, I bent the center wire on maybe a 2" radius and the insulation "snapped" in two. I was distressed to see this happen. Had I known, I would have gone for the "real" 9913 instead.

It seems to work great but there *are* some handling issues!! "Flex" as applied to this cable may lead to some erroneous assumptions.

4967. Yaesu is announcing the VX-7R

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-15 15:34:37 UTC
From: N9NWO <2121d@gte.net>
Message-ID: <3CBAF3B5.27D5ADE8@gte.net>
Source record: 44672

The May 2002 QST has an ad for the VX-7R
on cover 3 and it is now on the Yaesu web page
for Japan http://www.standard-comm.co.jp/Products/index.html

http://www.strongsignals.net/access/news/news.cgi?type=single&section=radio&entry=470

More VX-7R Details
Posted on 04/13/2002 09:52 EDT

John of Advanced Specialties Electronics was kind
enough to
send in more details of Yaesu's upcoming VX-7R:

"Internet key" for access to "WIRES"(Wide coverage

Internet Repeater Enhancement System)
True "Dual Twinband" receive
Submersible rating of 3 feet for 30 mins
Separate Memory Bank for Shortwave Broadcast &
Marine Band
"Multi Color Strobe LED"
Magnesium Case
These will be consumer advertised in the May
[hobbyist
magazines], so I would expect (guess) availability
soon.

Thanks for the added info, John!

And earlier this week, I was advised that Universal
Radio had
put up a VX-7R page which contains a cool picture of
the LCD,
more specs and optional accessories.

LINK: Universal Radio VX-7R page
http://www.universal-radio.com/catalog/ht/0777.html
LINK: Strong Signals VX-7R page

Ed,
I find it easier to work with. It's lighter. There are length
measurements right on the jacket. 9913 has a problem with water
intrusion, due to its air dielectric. I've heard of folks getting
water in the shack, even with a good, watertight connection outside.
Theory is temperature swings allows condensation of water vapor inside
the cable, over time.

From: Steve <zarco@sonic.net>
Message-ID: <3CBAFE26.4B0B@sonic.net>
Source record: 44674

Hi Gang,
I've got a very nice homebrew amp that uses a pair
of 4-400A's. It is very well built (not by me), is
fully metered, and self conatined (no external power supply).
Also VERY heavy. Rack mount. 80 - 10 meters.

The front panel and chassis could use some detailing.
One of the glass chimneys is broken, and some of the taps
off of the plate tank coil need to be re-soldered.

Asking $275 or will consider swap for solid state tranceiver.
Pick up only in Santa Rosa, CA. which is 50 miles north of
San Francisco.

Steve W6SSP

3 db seems rather high for an 80 foot run, but I don't know what brand of 9913 you used, or the quality of the connector installation. I use the 9913 type flexible stuff from Cable Xperts on all my antennas and it has performed very well over the past 5 years that it has been up.

Standard practice for me is to make up and test my feedlines before I put the antenna up, and I have tested many runs of this cable. A 100 foot run with quality connectors typically measures around 1.7 db at 144 mhz.

However, remember that even with 3 db loss in the feedline (regardless of frequency), if you are feeding an antenna with any reasonable gain, this loss is overcome. For example, a 100 watt input into a feedline with 3 db loss feeding an antenna with 10 db gain (with a SWR at the rig of 1.5 to 1) will still have a net gain of about 6.4 db and provide around 440 watts ERP. (The numbers get even better if the match is measured at the antenna rather than the rig, due to the feedline loss affecting the SWR measurement)

Considering the high costs of hard line and associated connectors (or the cost of a 400 watt amplifier), a gain antenna, a good SWR, and 9913 or LMR 400 feedline is a pretty cost effective trade-off... :>)

Excellent condition; 12 w AM and 20+ on SSB. No scratches - includes manual and mobile mike. I also have the chipset in a sealed, unopened box with manual for many additional features. $175 firm with three-day UPS shipping included. Contact me directly at catchthewaves@aol.com. This is an excellent radio with standard mod for 11.
Thank you,
Harold

4972. Ham Radio Recommendation for Tahoe Backcountry Emergency Use?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-15 19:06:46 UTC
From: aes <siegman@stanford.edu>
Message-ID: <siegman-FB6CD8.12064515042002@usenet.stanford.edu>
Source record: 44677
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.backcountry,rec.radio.cb

I'm an older guy who spends much of the winter doing day hikes into the Lake Tahoe backcountry on skiis, going maybe 4 or 5 miles into the woods or up canyons, most often alone (not counting my dog . . .).

Usually someone knows where I'm going, and I've been carrying a cell phone for possible accidents or medical emergencies, but cellular coverage is not always complete. So, I'm wondering about ham radio gear (or CB?) for possible emergency communication.

Question is: Any specific recommendations for a Radio Shack or other handheld unit that I could buy and just toss in the bottom of my backpack for possible emergency use? (No interest in chatting while on trail; just want an emergency unit just in case.)

(I'm told there are some repeaters in the Lake Tahoe region at 146-7, 224 and 442 MHz frequencies, and am digging further into this.).

Would a CB unit have any chance of having sufficient coverage?

I've got a growing number of 2 meter rigs that need new lamps to illuminate the display and the keys. The lamps that the Azden rigs used are 8V and are 3mm dia x 6mm long. I've seen these lamps used in Alpine car radios also.

Does anyone know of a source for these small lamps?

Thanks in advance.

Jim

I don't know about Barry, but the low loss of the LMR-400 was what sold me.
On 20 meters the attenuation is only 0.466 dB/100 feet.

A 12 volt lamp will work fine, but burn slightly dimmer...although they will
last longer! Radio Shack carries them.

First off, you might want to obtain the books on licensing for the amateur stuff. the CB re-quires no license, but I don't know how well a handheld would work in the wilderness.
The VHF/UHF ham gear would likely work, but you will need the license. This does give
you several options in that you can call for help via the repeater, or dial up 911 and talk direct to the ES authorities if the repeaters are equipped with autopatch.

If it were a perfect world, then if you get into a medical emergency, you would be able to transmit from a mountain top and you might be heard. Unfortunately, in my experience, you won't be on a mountain top when you need to call most. More likely that you will be down in a valley.

There are exceptions, of course. A couple of years ago, some folks were climbing on the north side of Mount Shasta, and they got off route and took a long sliding fall. Broken leg, I think. They had a cell phone, so they called 911. I believe that the call was picked up somewhere in Oregon and a 911 dispatcher in Klamath Falls handled it. They were able to take a forest service ranger in by military helicopter and drop him above the injured party.

That was reported in the news since it was kind of remarkable that the 911 call was received at all, even if you are relatively high on a mountain.

If you had a loss of 3 db at 150 mhz then something is wrong for 9913.
Using about 90 watts I have measured slightly less than 3 db at 432 mhz
for 100 feet. This was with 2 differant pieces of coax, one terminated
with pl259 connectors and the other with N type connectos. I did have
to use some adaptors but forgot what kind or how many. The losses of
the connectors were not taken away so the loss of the coax would really
be less than measured. I used a Bird meter and a Struthers (sp)
military wattmeter to double check the results.

Are you sure that was 9913 or was it just some other rg-8 size you were
using ? The run of the mill rg-8 will loose about 3 db at 150 mhz and
about 6 db at 450 mhz.

Suggest you replace these lamps with a LED + suitable dropping resistor.
That will solve the bulb problems (probably) forever.
Good Luck.

coverage?

CB is definitely out. No one around there is listening for a weak cb signal. Next to the cellphone you might look into a EIPRB or similar device. I may have the initials wrong on that. It's a emergency transmitter beacon that works with satellites. You can find these devices on lifeboats and aircraft. These devices will get everyone's attention so you need to be careful in not turning it on by accident. The Search and Rescue people have located these things down to someone's automobile trunk a time or two.

Tahoe's trails are usually surrounded by mountain and vegetation all yr long so low power hand held radios don't provide the absolute coverage you might need. There are a

few ham rptrs around there but I don't think I would trust my life to them. It would be best to get a ham ticket but in the case of an emergency you could use the radio to get help without the ticket.

>unit just in case.)

It's not quite that simple, I'm afraid. You need a license, not only to make it legal, but to know what you are doing on an amateur frequency--especially attempting to use repeaters.

Handheld amateur band radios are not simple (or cheap) devices, where you just have to turn it on, push a button, and talk. Frequencies have to be programmed in and you must know where the repeaters are and if it's likely you could access them from your particular location.

Operating VHF/UHF repeaters require knowledge of what the repeater offset is, what sub-tone codes are required to access the machine, what the protocol is for making a call (you must give your callsign first) and how the autopatch works (what keypad sequences are needed to be entered to operate the patch, or even if it is an autopatch repeater). Improper (or unlicensed) operation will most likely prompt the repeater control operator to shut off your attempts.

There are lots of sources for help in getting a license and learning what you need to know and newcomers are warmly welcomed and assisted by the many hams in the Tahoe area. But unlicensed operations are not tolerated well by hams on their bands and won't get very far trying to fake it.

For a person with no amateur radio license, you're best bet would be your cell phone. Go to your nearest cell phone outlet store, and see if they have some sort of extra powerful setup -- a higher power phone, a better antenna, a bigger battery pack, whatever, that would give you more range.

And when you're hiking, if the little antenna symbol disappears from your phone display, go no further. You're out of range.

Without a ham radio license, stay off the above.
>
>Would a CB unit have any chance of having sufficient coverage?

You might try Radio Shack and look at what they have in the way of CB or Family radios. But that would require two radios, and someone close enough to you for the two radios to connect, and for someone to be on the other radio.

Another idea -- I'm not that familiar with GPS satellite devices, but you might ask the folks about them at Radio Shack. There may be some sort of emergency service related to those radios.

4990. IC-765 Pin Diode Mod & PBT Mod ???

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-15 23:13:02 UTC
From: DCA <dalden@comcast.net>
Message-ID: <05nmbu8dj7lg8ckotl6i53jgq6ubs0o6ou@4ax.com>
Source record: 44694

I recently acquired a nice used Icom 765. I have heard reference to a mod that replaces the switching diodes with pin diodes to improve the receiver performance. Does anyone have any details on this mod? Someone told me there was an Icom service bulletin on this update but I cannot find any info on it. I do have the service manual though.

Also, there is a commonly posted mod that supposedly restores the passband tuning (PBT) function like it was on the 761. However, there appears to be some discussion as to whether this actually restores true passband tuning. Has anyone done this little mod and if so, what was your experience with it?

Thanks Very Much !

Type in your zip code. You should get a list of all amateur radio
operators in your area. Ask one of them, they should know the area the
repeaters. What I'm saying, Who better to help you get started then
somebody in your area.
Good luck!

I put up 9913 maybe about 5-8 years ago for my 2 Meter beam. When it was new, I measured 2 dB loss after I had all the connectors on it before I installed it (90') and I haven't noticed that it has deteriorated, but I was very meticulous about installing the connectors and how I installed them (going up under a box to the outside relays 1 horiz and 1 vert). I have been happy with it, I am sure if there is water in it, I would have noticed it by now. However if the LMR400 has better specs, go for it.

I concur with what Bob says. You will get very
sporadic signals from both Ham & cellular. What he's
describing is probably not a cheap thing, so check it
out before scraping all ideas though. Something is
better than nothing.

Comet and Diamond Antenna make mounts that attach nicely to the side lip of the hatch door. I've got two mounted near the top, on either side, and they work nicely. This area is black trim on my '97 so there is no paint to mar. Also, this mounting location is fine when you open the hatch, because the antenna lays out horizontally along the roof line, a bit outboard so it clears the roof.

Careful.. seen several rigs with melted lamp holders due to lamps getting too hot. Try the replacement.. if it gets HOTT.. then put a resistor in series. Melted Lamp holders can make a mess of the front panel..

Running PSK tends to get my FT900 a little warm, even at 50 watts out. I have thought about picking up a FL2100B amp, but I see in the specs it requires 100w drive for full output. Since I am only looking to get 200-300 watts out, would it be a simple matter of turning down the output on my FT900? Or by doing this would it cause problems to the transmitted signal coming out of the amp?

Thanks,

Max

Tune it to full out put. Then back the output of the HF rig down for the desired output of the amp. I just started listening to PSK31 a couple weeks ago. From what I hear 50W makes you a "Big Gun".

Hi Gang,
I am replacing some burnt up parasitic RF chokes that attach to the anode caps of the 572's. I see it's a few turns of wire. But that's it wound on? Is it a one watt resister or a ferrite slug or what?. Considering it looks like burnt carbon and the size of a 1 watt resister, I'm leaning in that direction. Does anyone know for sure and if so the value?.. Does anyone know where these guys should resonate or the "Q"? I would think above 100MHZ?

Mater of fact it will. Not by much, but still 0.4 db at 440 is an advantage
where I'll take any I can get.

> >
> > The only better choice is hardline and the expense of cable and
> connectors

Even then I'd pick the larger LMR cables if purchasing new cable in that
expense range.
LMR 600 ($1.19) is a good UHF cable if the runs are not too long and the
connectors are about a half to a third the cost of 7/8ths Heliax connectors.

However you could go to LMR-900 (bout $4.00 a foot)which is pretty much the
same as heliax in performance...It will make much sharper radius bends
without damage and the connectors are only slightly less than the ones for
the Heliax.

> > is prohibitive for most hams.
> >
What? $85 plus for 7/8ths UHF Heliax connectors is high...<:-)) That was
for just one and I think the price has gone up substantially since I
purchased the last two for the repeater.

Type UHF Male for LMR 600 is $26

Tom wrote:
>
> Which have the better receivers??? The original 746 or the current TS-2000
> ?? Ive been told the 746 is much better built for 100% duty for RTTY and
> PSK compared to the 2000. Would appreciate any comments on which is better
> receiver though.

There's a lot to look at. If you compare the ARRL
test results, you'll find that the 746 outperforms
the 2000 about 2:1 in SSB reception. On the other
hand, the 2000 outperforms the 746 about 5:1 in FM
reception measurements.

You really need to decide what's important to you
and look at the testing results for yourself. As
you will discover, they each have their advantages.

The 2000 has backlit keys. The 746 has a large LCD.
The 746 has Twin PassBand Tuning while the 2000 has
a more capable DSP. The 2000 has a sub-receiver for
dual watch, while the 746 has a scanning spectrum
display. The 2000 has better sattelite capabilities
while the 746 has better AM performance. 100& duty
cycle is no sweat for the 746, but then UHF bands
are no sweat for the 2000.

And that's just a sampling of the differences. You
will find supporters and detractors for each. You
shouldn't hold out much hope for concensus on the NG.

I STRONGLY urge that you find these rigs somewhere
(dealer, club, contact, etc...) and try them out.
More important than any test measurement is how well
the radio fits your usage style. Nothing you read
will reveal this (the most important) aspect to you.

Good luck.

Dana, KB9SSS

Sorry, I missed W6DKN's original question...

It was Belden cable and the connectors were silver-plated. It worked quite
well but I was still quite surprised at the losses. Connector installation
should have been fine... been doing it for 50 years including about 12 years
professionally.

back in the early 80's, we were putting radios in new LTD squad cars

the city insisted on having the antennas mounted ON the light
bars.............well, there was about 3 extra feet of light bar cable left
over, so the install guy made a loop around the 'computer' (actually, the
ignition module) on the left inner fender

all was well until a car was going balls-to-the-wall to an accident one day,
the driver hit the button on the mike, and the ignition died, just like
you'd turned the key off

only on one channel of the radio, and only at wide-open throttle

but boy, did we have fun 'diagnosing' the trouble.....we must have
used 5 tanks of gas 'trying to duplicate the problem'.....

Forget about CB's, handheld won't get you much coverage and besides
unless you're by a highway it's not likely someone will be listening
for a distress call.

If there is repeater coverage in the area where you want to hike, then
a 2 metre ham radio will probably do the trick *most* of the time. As
someone else suggested here, go to http://www.qrz.com/i/names.html and
find out who is a ham operator in your area and they'll be able to
help you much better than any of us here.

Maybe you could get a local ham to scout out the area where you hike
with their radio to see if it's worth it for you to invest the time
and money in ham equipment and passing your license. You might be
surprised at the repeater coverages.

I've personally used a repeater in the adirondacks to call in a rescue
for a lost child a few years ago and the local hams were extremely
helpfull and professional. They had the local Rangers over in a flash
and the kid was found within a few hours.

My 2 cents...

A friend has some radios for sale. Which of these is easiest to convert to other VHF-lo frequencies or possibly up to 6m? By easiest I mean it can be changed by dip switch/computer reprogramming/PROM swap but if not, whichever one has the most available parts and is easiest to convert with a minimum of retuning. I am assuming the two tube units would be the most difficult to work with. Are either of the Motorolas reprogrammable with a new prom or computer upload?

If you know anything about these radios please let me know as all I have are model numbers. They are all set up for at least two channels on 46 Mhz.

RCA MBA19MAII 2 chan mobile $150
GE Master-II Model LB1-44506 2 chan 100W mobile $150 w/manual
Motorola Mitrex 75V 4 chan w/ remote head and manual $225
Motorola Twin V model T61GJD-3A-PH50 2 chan 100 W mobile runs off of 6/12V $50
Comco 580-HA 2 chan tube base &extra parts $50
Comco 2 chan tube mobile $25

Thank you!!

These are all crystal controlled radios (I am not familiar with the
RCA, but most likely it is the same vintage). That is, to set them to
a new channel frequency requires installing new crystals (a pair, one
for receive and one for transmit) for each channel. After installing
the crystals it will be necessary to retune the radio. This will require
a signal generator, 50 ua meter, RF power meter and some tuning tools.
It is also a good idea to have the manual with tuning instructions.

The Mitrek should be fairly easy to convert to 6M. The tube models
will probably require some modification, i.e., changing some tuning
capacitors.

BTW, some of the prices look kind of high.

All good responses thusfar. I agree, forget CB.

An EPIRB would be very affective, as mentioned previously. But it might take a couple of days for your signal to work it's way thru the sattelites, FAA, local authorities, and ultimately to a SAR (search and rescue) group. Can you wait this long? A cellular telephone or amateur radio would be faster.

Key to both Amateur Radio and cellular telephones is understanding how radio waves propogate. For VHF and UHF it's basically line of sight. I know this is an oversimplification but in a general sense it's true. Getting your ham radio license will teach you all about this. This means that the receiving station needs to be on your side of the hill, or you need to hike to the top of the hill. You must know where the local cellphone towers and Amateur repeaters are located, this is crucial information.

Don't bother trying to use Amateur Radio gear without knowing what you are doing, it would not work. It's difficult to grasp while in the comfort of your own home, let a alone when you are lying in the woods with a broken leg. Again, getting your ham radio license will teach you all about this.

Sometimes I take a cell phone and sometimes a 2-meter HT. It depends on the area. In the past I've taken Amateur HF gear along for doing CW, but my code is getting pretty rusty so it stays at home now. I can't make any comments specifically on Tahoe.

Can anyone help me or give some advise? I am a college student who bought an incomplete radio set for $1000 (it was missing an important, hard to find cable) from Carl Konefsky nearly 2 years ago and he said he would forward the cable to me via mail (the cable was part of the original deal). Nearly a year later he finally admitted he couldn't find one and agreed to return my money if I shipped the set back. At $70 shipping out of my pocket I returned the radio. He has since sold the radio and has never done anything further than promise to return my money but never has send me a cent. He has had the radio since early last fall and no longer has it. I have plenty of emails from him promising he'd send it but nothing has happened. What can I do? I live 1500 miles away in another state. His latest excuse is he sold his camper to pay me (a couple of weeks ago) but evidently that was a joke on me too. I have his phone number (I'll give it to anyone who will help) and both I and my Dad have called him and each time he says he'll send it next or the next day or whatever... My Dad tried to help but even he gave up. I certainly would appreciate any help on what I could do next. I am going to school now and work hard for my money and all I want is to get my money back and I think Mr. Konefsky is taking advantage of me just because I'm a college student. If anyone is interested, I have copies of all the email correspondence over the course of the last nearly 2 years. Thanks to anyone who can help....Steven.

I don't know but I wish the folks in this NG would not be so quick to
recommend "getting a ham radio" everytime someone requires occasional
communication outside the range of FRS or CB. They make it sound like
getting a fishing permit.

Carl:
You might consider something innovative as I had to do on a lease vehicle. I have a 99 Explorer (Limited) and there is NO spare space , so I made up two inverted "J"
brackets; bolted them to the mobile mount bracket, mounted the bracket to the bottom of the radio and hung it from the center console(open the console, hang it on and close the cover). No holes to drill, easily reachable/readable and when I leave the vehicle for an extended period, I open the console; raise the radio up and slide it under the seat. Works for me! If you're interested, e-mail me direct and I'll tell you about the "no holes visible" roof mount I made! G.I. ingenuity!

> make any comments specifically on Tahoe.

There are a few models of "Back Packer" low power, HF radios that would be
suitable.
Most (all ?) of them are CW (code) only so knowldge of code would be
required.

High frequency (7 or 14 MHz) would get out from most any place.

Yes, it will work. (It is just a coil and cap in a box so don't pay too much for it.)

It connects to the ground on your rig. A length of wire is attached to it and the
coil and cap in the box are used to resonate the length of wire to the frequency
on which you want to operate.

It will keep you from having to have a different length wire connected to the rig
for each frequency on which you wish to operate.

The only drawback is the wire will be RF hot during transmit.
If it is inside a house or apartment, that might present other problems but any other
wire being used as a counterpoise would have the same characteristics.

It is linear simply because that is the scale they wish to use. Putting it
on a logarithmic scale is certainly possible.

> apply.

??? What are you talking about? There's no such thing as a "log. power law" and anything that can be expressed
in numbers can be converted to a logarithm of some kind, including pay. What you call "log. power law" is
nothing but a ratio of two power measurements over the same impedance. Base 10 is used because it is easy to
work with and easy to visualize on scales and graphs, but it could be any other base. Decibels describe
nothing but ratios of two numbers, that is all. They are not a basic unit of measure like Volt, Ohm and such.
The reason they're used in power measurement is because it is easier to work with 60 dB than with expressions
like P1= 100000 P2, i.e. it reduces the enormous linear scale to a readable logarithmic one.

> > Lesson learnt.
>
> Two lessons :
> a) Even a complete idiot can become a Senior Engineer

The guy was right because he wanted to point out that 1 dB is not insignificant when taken personally, and one
should not take 1 dB drops for granted.

I had one (it might still be in storage); used it in an elevated station where I didn't have much of a ground; twisting the knob on the device and watching the little meter didn't seem to make any difference whatsoever in the station's performance. Others might have different experiences.

==========

That was my thinking. I built a few different QRP (low power) radios for the 30-meter band. The entire setup (radio, battery pack, key, and dipole antenna) weighed one pound. I used it a couple of times in the field and it all worked fine.

Yet this rig presented a unique problem, the signal went too far. If you broke your leg in Nowhere, New York you could talk with someone in say Texas or Europe. I suppose this is better than nobody, but it's usefulness is greatly diminished after the first skip. Of course if you were in a very remote region of the world this would be great.

The solution to this problem is to move to a lower band (with a subsequently larger and heavier antenna) or just use 2-meters. I chose the latter.

I bought some of the 9913F when it first came out about 1995, and likewise was disappointed in the performance vs specifications. From my as-built notes:

3.48 dB/100' @ 440 MHz
2.44 dB/100' @ 144 MHz

For comparison, I had also measured some "special" Teflon double shielded Belden RG8/U (Ethernet cable?) that I picked up surplus for $0.25/foot (wishing I bought more) and found 2.38 dB/100 @ 144 MHz. The odd-ball surplus RG8/U cable is just as good (at 2M) and cost one third of the RG9913F. I recently stripped off the cables from the tower. The 9913F looks ready for a junk heap after 5 years, the surplus teflon stuff looks like new.

At the time, I called Belden concerned that my type N connectors were to blame. Belden wasn't too concerned about the connectors I was using, saying that the cable losses were "typical". In other words, don't get too impressed by the catalog spec.

I wanted to add a comment about a mode of communication used mostly by
the military. It's called NVIS (Near Vertical Incidence Skywave). You
basically lay an HF antenna on the ground and pump a kilowatt into it.
The signal goes pretty much straight up then bounces straight down.
This lets you talk to someone in the next valley over, while hiding you
from enemys with radio direction finding gear on the ground.

This would be great for us backpackers, if someone else carried the
amplifier and generator.

I am afraid you will discover real 9913 isn't any more flexible. About
1 meter radius is about all it is good for. What you have lost track
of is one of the reasons it has such low losses is that isn't very
flexible. That allows the use of dielectric materials with lower
losses.

The The foam inner dielectric is much lower loss at UHF frequencies
then solid plastic, and the solid core has lower losses then stranded,
and the nice big center conductor has a nice big surface area, which
is where the energy actually travels anyway.

The lowest loss cables aren't flexible at ALL.....

Mention should be made of the ARRL Wilderness Protocol. This encourages hams to listen on 2-meters once an hour for distress signals. Go here for a little more information:

http://www.liscar.org/wilderne.htm

So a 2-meter radio can be affective without a repeater, if there's another radio amateur in the area.

I, too, was not at all happy with the actual Belden stuff, but the
"improved" 9913F like Cable Xperts sells is a "different animal"
altogether... I have several runs that have been up over 5 years in the
Mohave Desert heat and sun exposure, and they are still in excellent shape.
I also have 3 runs that have been direct buried (no pvc, etc) for about 3
years now, and they still test out fine.

ONE, NEW, ANTENEX brand, Phantom model, 3db gain, 450-470 MHz,
"Transit" style, UHF Antenna. Antenex part number TRA4503. It is NEW
in the bag. This antenna mounts to a standard MOTOROLA style mount
(NOT INCLUDED IN THIS AUCTION). I have been using this style antenna
for my personal equipment and I am very happy with the results. Great
for low-profile or unmarked vehicles!

Two listings!

5060. FT-847 strange problem

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-17 05:00:30 UTC
From: Brenda Ann <brandad@kornet.net>
Message-ID: <a9iukb$g2l$1@news1.kornet.net>
Source record: 44567

I have an FT-847 that has suddenly developed a problem... it was not there the last time I fired the rig up. Here it is: It receives, but does not key up, anywhere below 40m... (i.e. 80 and 160m). I key the mic, or the MOX, and get an Error message, like it was trying to operate out of band. Anyone know what the problem could be, please e-mail me.

TIA

WRONG! Decibels describe the ratio of two _POWERS_.
That the ratio is dimensionless is neither here nor there,
for it is the fundamental definition that _POWERS_
are being compared.

Warning! Do not feed the META_TROLL! Comments
such as the above are likely to institute a childish
tirade from THE GOOD DOCTOR (who recently
signed himself as "El Culo", whatever that may mean?)
about not feeding the TROLL.

Never mind good people.. I've solved the mystery. Seems the other day when we had a t-storm, we got a jolt on the electrical system.. killed one of my computer monitors.. seems also it glitched the computer in the 847.. I reset the CPU and it once again works as good as new. :)

Take care, and stay well.

Source record: 44570

Hi,

I've an ICOM IC-761 transceiver and the ability to memorize frequencies has become erratic. I presumed that this was merely a case of changing the 2032 cell but I'm a bit surprised to see that the Instruction Manual says that this should only be done by an authorised ICOM dealer or service centre... I remember hearing somewhere that the rig's 'operating system' could be also affected if this battery became exhausted so I'm concerned that I do not cause more problems as I remove the battery.

Do I need to wire a temporary supply across the battery holder whilst I change it and can I safely remove the RAM unit from the rig to do this (it appears to plug in).

I don't wish to have to use my beloved '761 as a doorstop !

5069. FS: two Tempo One's and one p/s

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-17 13:11:06 UTC
From: k5dh@raytheon.com
Message-ID: <Kvev8.707$Bd4.4983@dfw-service2.ext.raytheon.com>
Source record: 44574
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

For sale:

Two Tempo One HF xcvrs and one PS/One power supply / speaker.
They are both scruffy, the cabinet paint is really ugly, but
cabinets are not dented/rusted. Front panels show a fair bit
of wear and some scratches, but they are not "trashed". Both
rigs are dirty inside, but it looks like mostly dust and lint
rather than "grime". One has all four 10m xtals, the other
has three 10m xtals (lacks the 29.5 segment). These do not
appear to have been used on 11m CB. The rigs have NOT been
tested. Working condition is unknown, although I was told
they were at least "operational". One rig has a small toggle
switch added on the lower part of the front panel, reason for
this is unknown. PS/One cabinet is also badly scratched up,
but not dented/rusted. PS/One is dirty but not grimy. One
PS-to-xcvr cable is included. I can supply a PDF-format copy
of the manual and schematic on a CD-ROM if you need it, and
also the service manual (which isn't much, but it's free).
This gear is offered as-is. Expect it to need repair work!

Offered as a package: $125 plus shipping

You're right on all counts. I guess I didn't make my intent clear. I intended only to say that the 9913Flex is NOT as flexible as one might assume from its name.

Thanks... Ed, W5EJ

I am putting up a Diamond dual band vertical antenna. It will be for 2m and
70cm with about 60 feet of LMR400 coax never run underground.
My problem is should I buy the antenna with the UHF or the N connector? What
are the pro's and con's to both? Is a UHF the same as a PL259?
And if one connector is better than the other then why is there any choice?
Also I have experience in soldering up PL259's but no experience with N
connectors. Are they hard to solder up to coax?

The N connector is a constant impedance, where the UHF, or PL259 is not.
Especially if you're going to run some power on 70 cm, the N is preferable,
moreso at higher frequencies.
Why are there so many connectors? I dunno. The history probably involes the
military.
My Collins S-Line uses RCA connectors at the 100W level and N connectors at
high power.
N connectors are no more difficult to assemble than PL259 (UHF) connectors

You really want to run *that* much power on PSK31? You would be better served by turning the power down. 30 watts or lower. I usually use 10, and that isn't considered all that low for the mode.

For this app, either will work OK.

> What are the pro's and con's to both?

The N connector is a constant impedance, waterproof connector. The UHF
(PL-259) is neither, although proper preperation and installation of the
UHF connector minimizes these issues considerably. Again, for your use, it
doesn't make a lot of difference either way.

> Is a UHF the same as a PL259?

Yes

> And if one connector is better than the other then why is there any
choice?

Because choice is good ... :>) (and they sell to a global market, where the
standards can vary)

> Also I have experience in soldering up PL259's but no experience with N
> connectors. Are they hard to solder up to coax?
>

Not harder to solder, just requires more precision. The coax has to be cut
and prepped to exactly the correct lengths or the connector does not
assemble properly. And the soldering requires more precision, especially on
attaching the tip. Too much/sloppy solder and it won't go into the
connector body correctly.

I use UHF connectors for 2/440 and have no problems with impedance or
excessive loss, or moisture. Above 440, I use N connectors for their
impedance and loss advantages at higher frequencies, as well as
convenience - because this is the typical connector on antennas and
transmitters for these higher frequencies.

WIRES is a system where people string up copper braid along telephone poles, & around existing phone wires. If you point the VX-7 at/near these wires & hit the "Internet" key, the radio will "slave" off the nearest DSL line (using quantum Positronic sub inductance) & you will be able to access Ebay auctions.

I once asked you to explain why dBsm - with which you claimed some
familiarity - was not a power ratio but a ratio of two fiddle-factors
having the dimensions of square metres when using the radar range
equation to compare differing components of that equation.

The silence was deafening.

I give you another opportunity to explain.

PL-259 = "UHF" connectors ... a misnomer if there ever was one.

"N" connectors are designed for higher frequencies ... they are
"constant impedance" (they maintain 50 Ohms throughout and
thus don't make an impedance "bump" ... IF they are put together
correctly.)

I wouldn't use a PL-259 for anything above 6m myself, given a
choice (yes, I know that most 2m rigs and some 70 cm rigs come
with those connectors ... but I'd be willing to spend another buck
or two for the better "N" connectors if there was a choice ...)

The choice is based mostly on cost ... plain and simple ... N's
are more expensive than PL-259s ... and different, but not
exactly more difficult to assemble properly ... PL-259s can
be put together badly, too (and often are ...).

If it were me, I'd definitely spring for the N connector on a
2m/70cm dual band antenna ...

9913 works good in the desert. If you live anywhere where there is moisture, it will fail due to moisture (eventually). LMR-400 performs better, is more rugged, and doesn't get water in it. It is easier to attach connectors to as well.

LMR-400 is available from cable experts.

It's time to use the research and development bucks spent on the PRO series,
and apply it to a new mini rig. Using ALL digital DSP systems they can
shrink the radio even more than the FT-817, but operate like a PRO II, on
all bands HF-1.2Ghz. Optional 100watt PA unit, or 10 watts standard unit.
Wireless remote/handmic/display unit.

WE draw ever closer to the "Dick Tracy" wist-watch radio. Only thing
slowing us, is the lack of new battery technology. Big bulky, low output,
toxic batteries don't seem to be going away.
And by the way, where the HELL is my hover-car, we were all promised
hover-cars by now! And self-cleaning houses, and weather control, and,
and......

5098. Going mobile in a Ford Aerostar

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-18 03:00:38 UTC
From: dplatt@radagast.org
Message-ID: <ubsdmmqdah0h46@corp.supernews.com>
Source record: 44504

I'm a new-guy-on-the-block (just passed Technician a few weeks ago) working towards my General. I'm currently on the air with a Yaesu VX-5 handheld, and want to put together a setup for both home and mobile use. 2-meter/70-cm at least, and HF would be very nice to have even though I can't transmit yet.

I'm tempted to get a Yaesu FT-100 due to its flexibility and small size, and use it as both a base station and for occasional mobile use (e.g. trips etc.). The VX-5 handheld could be my day-to-day mobile as well, although it wouldn't be as convenient.

I'm wondering about several issues, including antenna/mount, and interference.

My vehicle is a 94 Ford Aerostar - the "cargo" configuration with no seats in the back. It looks as if the easiest way to mount a decent antenna would be to put up a dual-band whip using a hatchback/trunk adapter connected to one of the rear (vertical) door edges. I imagine I'd want a whip with enough flexibility to survive hits on low-hanging branches, carwashes, etc. - the Aerostar's a pretty tall vehicle to start with.

A mag-mount would allow for really easy removal, but I've read so many peoples' messages saying "They don't stay in place, they're more of a hassle than they're worth" that I'm leery of using one except in emergencies.

Is this (trunk-adapter-mount-on-rear-door) a reasonable idea? Suggestions for antenna type? Are any of the "oddball" antenna types, such as an Antennex stealth model, worth considering?

The other thing I'm concerned about is interference. I was concerned to note that starting the engine was enough to cause the VX-5 (tuned to 440-something) to un-squelch - I had to crank the squelch level up to 9 or 10 to get it to quiet down. This suggests to me that the engine (EMC or ignition) is radiating quite a lot of noise. It happens even with the VX-5 on its own battery - it's not just a conducted-noise-through-the-power-adapter problem.

So - where to I start to clean it up, so I can hear other people and don't end up transmitting a really grotty signal? Bypass capacitors/snubbers on the alternator and fuel pump? Ferrites all over the ignition wiring? Bond everything together with braid?

I've read through the ignition-interference information on the ARRL web site for general background - can any Aerostar owners suggest specific fixes which have worked for them? Have you had any problems

with the engine/ignition control computers being affected when you transmit?

Lots of questions, I know... thanks for reading and for any tidbits you can throw my way.

Source record: 44507

Hi all. I've recently hooked up a Kenwood TM-733A in my car. Today, when I went to transmit the radio freaked out. Now, all it does is flash -ok- (what it does after it is turned on) and the two small green band indicators are flashing. I've tried all the different resets I've found on the web. I've also tried disconnecting it for awhile. No dice. Anybody ever seen this before? Anybody know how much It would cost to fix this kind of problem.

5103. Which Radio?

Do yourself a favor and avoid N connectors whenever possible. I know,
the purists will say they are better, and of course they are - a little,
not a lot. Not enough better to justify the extra cost and hassle. Yes,
they are a hassle. Almost no one does an acceptable job of installing
their first N connector. If you ever installed one with the center pin
even slightly off exact center, which usually results in breaking off a
segment of the receptacle in the female center, which then results in
the job of replacing not only the misinstalled N connector you just
messed up, but also changing out the N female assembly as well- a near
impossibility on some devices such as antennas- you'll understand why
General Electric used UHF/PL259's exclusively throughout their Master II
line of UHF gear, among others.
Some newer connectors are easier to install correctly and better than
older versions. How do you know which version you are buying? Is it an
"easy" one or not? There are an awful lot of "older" ones still out
there on the market.
The *small* advantage of N connectors over PL259/UHF types through
around 500 mhz is just not worth it.

5107. FS: PRC-77 radio set, complete with many accessories - $300.00

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-18 04:50:25 UTC
From: Mike <mdavids@erols.com>
Message-ID: <3CBE5091.48AA@erols.com>
Source record: 44512

I have one complete PRC-77 military radio set for sale, complete with H-250 handset, both the ribbon and the long base antenna, with both antenna base mounts, a barely used magnesium battery, and the accessory pouch, complete for $300.00. The radio is tested 100%, works great, works on two bands, 35 to 52 MHz, and 52 to 75 MHz. Great set for the military radio enthusiast. PRC-77s normally sell on Ebay for $400 with no accessories. Email me at mdavids@erols.com if interested, I have a picture of the setup.

I drive a 4-Runner.

The control head is mounded on the console with double sided tape for the
bracket.
The RF deck, which is mounted on an Aluminum plate goes under the seat.
I was going to put some velcro on the bottom to keep it from sliding, but
never found a need.

Since the Spectra transmits on all the bands you mentioned, why not just use it by itself? A quick check of my AES catalog didn't reveal any duplexers that split the 800 MHz band separately from the 400 MHz band.

Whew Dick, you just qualified yourself as a member of the typical 'ham'
community.
N connectors are a bit more challenging but only to those that would
feel a PL-259 is also challenging. If you can handle one, you probably
can handle the other. I don't mean to throw off on anybody but I have
known hams who just couldn't get the knack of putting on a PL-259.
As for the loss and match bizness...a PL-259 may well cut muster at 450
MHz but its a crap-shoot. A 'N' will almost always win. If you don't
have the mechanisms to measure (assuming that such is critical in the
application), you've really got better odds as a first-timer at 450 with
an N-connector.

WRONG! It's nothing like your silly comment about
Canada and the USA. In the case of the dB, it's
a matter of resorting to the fundamental definitions.

All measured quantities are expressed in numbers,
so your second comment is rather silly, OM.

I personally think N connectors are eaiser to install. You don't need a gazillion Watt solder gun to heat up the shell to solder the braid, thus melting the plastic outer sheath on RG-8. With N connectors, the braid is clamped to the shell by the rear nut. The onlt soldering needed is the center pin...if you go heavy with the solder, carefullu trim it off the outside of the pin with an exacto knife or utility knife (sharp) and you're good to go. To prove which connector is better, use a TDR (Time Domain Reflectometer) and look at the impedance bump of each type of connector. You will see the N is better. Like all connectors, it just takes practice like most other things in ham radio.

PROTEST!
========
The *small* advantage is valid only, and only when the UHF
connector is mounted at the coaxial cable *the correct way*.

It is not more difficult to mount a N-connector than an UHF.
It is HARDER to make a PROPER UHF-connector installation than
a corresponding N one. I've seen real TERRIBLE installations of
UHF-connectors. The problem is, You can install the UHF in a
Quick-and Dirty way, and You will have SOME fuctionallity, for

SOME time, still. A N-connector can be installed correctly, or it will not work (or breakdown). Installation of a N-connector is self-explanatory, PROPER installation of UHF needs EDUCATON. For an outdoor applocation such as an antenna connection, if You choose UHF, You'll have to make sure it is correctly done.

UHF-connectors should be forbidden in law. I'ts one of the worst inventions ever made. They ARE hard to install the correct way (You DO need a soldering iron > 75W, It is hard to be sure You got a good enough braid connection, You are more-or-less BOUND to do damage to the cable if You do not know the EXACT amount of heat that should be applicated by the soldering iron. Etc. Etc.)

N type PRO: Attaches the braid with a clamp, not solder. There's much
les risk of damage to the dielectric.

N type PRO: More weather resistant.

N type CON: Must strip and trim the cable accurately, or else the
center pin won't seat properly. That causes most of the trouble in N
type connectors.

N type CON: It costs more, but then again so does the LMR cable!

Losses: Not enough to worry about IF the PL-259 is of good quality,
properly attached (good soldering, especially), and you're not running
high power.

I'd recommend an ICOM 7062G instead. A few FT-100s have had troubles
that'd drive a new guy nuts.

> The VX-5 handheld could be my day-to-day mobile as
> well, although it wouldn't be as convenient.

You can say that again! Mine gets too hot to hold after a few minutes of
normal QSO - great radio for quick check-ins but don't expect to chew
the rag. Also, only 5 watts isn't enough in rural areas like my QTH and
tiny, multi-purpose controls are hard to use mobile. Worse, its mucho
hard to change even squelch without one's undivided attention (Arrrg,
look out for that truck!) Recommend spring for a good mobile like the
FT-7100 or, better yet, the 706Mk2G.

> antenna would be to put up a dual-band whip using a hatchback/trunk
> adapter ...

I'm with "radiofun" on this part. Your van's roof makes a great
groundplane for VHF/UHF and even a mag-mount in it's center will be
better than anything way off center. For HF look into a "screwdriver".

>
> A mag-mount would allow for really easy removal, but I've read so many
> peoples' messages saying "They don't stay in place, they're more of a
> hassle than they're worth" that I'm leery of using one except in
> emergencies.

The 5/8 2m whip on my pickup has been there 2 years without a problem.
YMMV.

>
> ... I had to crank the squelch level up...

That's why I recommend a mobile with a dedicated squelch knob that can
be adjusted without having to take your eyes off the road.

> So - where to I start to clean it up,...

Try some QSOs before doing anything. Much of your "problem" may be your
radio. My VX-5 has a *very* sensitive squelch. The RF from the AC here
at work trips it (... lessee: tounge on left eye tooth, left eye closed,

right ear ... ooops -halibut!- that one is for mode ...) Check into the net on your local repeater and ask if oyur signal is OK.
If so, enjoy and welcome aboard.

The UHF is the same as a PL-259.The N is harder to solder than the UHF. If you practice with one or two on a juck piece of coax, then put one on your coax, go with the N. In antennas for comercial equpi. they use N. If I could I put N on my equip.

For sale:
Yaesu FT-920 100W 6-160 meter transceiver,
MFJ model MFJ-941D Versa-Tuner II,
MFJ model 1278B Multimode Data Controller (handles AMTOR, RTTY,
Packet, SSTV, etc)

All items are lightly used and in excellent condition.
The Yaesu's total transmit time is under 1 hour, CW only. This is a
great-looking rig.
Includes mic and all manuals, original packaging.

Price: $1200 for all. Buyer to pay shipping from Austin, Texas.

Amp Supply Co. LA-1000 HF Amp. 160-10m

Have for sale or trade an Amp Supply Co. LA-1000 HF amplifier. Late 80's model, with Ameritron serial placard. Manual states 500-600w output. Tubes are doing about 450 on 80m. Amp is in good shape and working perfectly but has a few scratches. Power switch has been replaced with incorrect but heavy-duty switch. Looking to sell or trade for a Dualband mobile such as TMV-7A or similar. Will only consider Icom, Kenwood and Yaesu mobile ham radios depending on mod availability. Will also consider only Motorola/Radius handhelds or mobiles (Max, GM, M1225, etc, as well. Jedi, Radius or Pro series.) Prefer VHF. U-ship, (will average $20-$35 CONUS). Thanks and please reply direct,
Randy, KC8CPK

Hey, no fair! Before you get to have that law passed, you have to
honor the priority of another "Get rid of a truly terrible connector
design" project - one intended to stamp out the fundamentally-evil RCA
connector. Talk about a bad design... yuck.

I'm only half-joking... ;-)

"M.E." <bogus@nospam.com> wrote in message news:3cbcb590_1@newsa.ev1.net...
> This is a really silly question.

And what makes you think that?

a. My RG58 cable is buried for concealment from the landlord to permit my HF activity.
b. I do not have the room (or the lawn) to bury larger cable, thus I am limited to the power handling capacity
of the RG58.
c. I did not specifically say I would be running PSK only.
d. If you saw the antenna I have managed to rig up, you would understand I need all the power I can muster.

So in my opinion I really don't think the question was all that silly. I have never owned an amp before, therefore I am not fully up on the do's and don'ts concerning their use. In the past I have always received great advice from people in this newsgroup, but every now and then.....

And that e-mail address just confirms it.

Source record: 44539

I just ordered an IC2100 and it should be here tomorrow. Having just come in from looking at the 2002 S10 pickup I want to mount this in, I am wondering what other people have come up with as to a mounting location??? The only actual clear space under the dash seems to be right in front of the driver & I don't think I want to have a mic cord draped in front of me. It seems that placing it anywhere else under the dash will block things like heater ducts, lights, etc. Anyone have a rig in one of these little trucks?? And where did you mount it??
Any suggestions very welcome!

I don't have the specs to hand but can help further with equivalents
from my old "Service Valve & Semiconductor Equivalents" book
(published by RSGB in 1967).
CV25 : ES85 (AEI), 424A (STC), 242C (Am), UE311 (Am), 211 (Am)
CV622 : 802 (Am)
CV704: RK20A (Am), CV624
Now for CV624 we have : 804 (Am).

Where Am must be American Manufacture (these days we'd say "USA").
and, of course "valve" = tube.

I read a test report in which the author compared UHF and N connectors on a network analyzer. I was surprised at how bad the UHF connector actually is at UHF...he measured about 1 dB insertion loss per UHF connector vs. about 0.2 dB loss per N connector at 440 MHz. Add the loss of the coax at UHF to twice the insertion loss, and you've cut your effective power in half! Yikes!

I found this article enlightening:

Was the insertion loss due to mismatch or to actual dissipative loss? If it's mismatch, the "loss" can be eliminated by a matching network.

Here's an example to show the difference. Suppose the connector is right at the load, and that the generator is set up to provide 10 volts RMS (2 W) to a 50 ohm load. The generator voltage is then 20 volts RMS. If the connector's impedance at the test frequency is a resistance of 12.2 ohms, the load will see 50/112.2 * 20 = 8.91 volts RMS, a reduction of 1 dB from the 10 volts it would have gotten without the connector. If this is happening, the connector loss is truly 1 dB, and the loss can't be recovered. But on the other hand, suppose that the connector's impedance is a pure reactance of 50.9 ohms. The load will see 100/(sqrt(100^2 + 50.9^2)) = 8.91 volts RMS just like it did with a resistive connector impedance. So the "insertion loss" is 1 dB, just the same as for the resistive connector. But this is different. We can make the insertion "loss" disappear entirely simply by adding a series reactance of the opposite sign at the connector. This cancels out the reactance, and the load gets its full 10 volts RMS (2 watts). This second case shows the effect of, and cure for, the impedance "bump" caused by a connector that doesn't have the correct constant internal impedance. In many cases, you'll have a matching network anyway, so you can adjust out the effect of the impedance bump with minimal degradation to your system. (The only possible degradation is a slight increase in the SWR on the transmission line, if the mismatch is at the antenna and the matching is done at the transmitter. The increased SWR could lead to increased loss if the line is quite lossy to begin with and the SWR increase is appreciable.) A UHF connector with Teflon insulation isn't likely to have much resistive loss -- measured "insertion loss" is more likely due to impedance mismatch.

"Insertion loss" is similar to the concept of "mismatch loss" or "reflection loss". I recently wrote about those in the thread "Suggest coax for long run" in rec.radio.amateur.antenna, on March 27 and April 10. You should be able to find these at http://groups.google.com. There was also some discussion recently about misapplying modeling results to reach invalid conclusions. If a measurement is made of a connector's "insertion loss" and it's taken to imply that it represents real dissipative loss, then this could be a good example of that misapplication being done.

I fully concur. Have installed and used hundreds (at least) of both.

I see a lot of responses to the UHF-N question and I'll add my $.02.

UHF connectors were designed when UHF was considered to be anything
about 30 MHz. Currently the connectors come with a wide variation in
quality. If you are determined to use an UHF connector get ones with
teflon dielectric. I have seen them with nylon dielectric which will
melt with moderate power at even 2M. Nylon is very lossy but is cheap
compared to teflon. I find that it takes longer to properly assemble
an UHF connector than an N. There is one solder connection on the N and
two wrenches are required to finish the assembly. The N connector will
have good dielectric material unless you are able to find a really off
brand source.

The other thing you need to consider is the loss of LMR400. If you are
planning a run over 50 feet you might consider something like 9913.

No problem.. This is the proper use of cross posting. One
should use crossposting to a few closely reverent newsgroups
rather than sending individual posts to each.

>
> I'm looking for data - pin out, max ratings, typical

>
>I'd recommend an ICOM 7062G instead. A few FT-100s have had troubles
>that'd drive a new guy nuts.

I looked through the user reviews at www.eham.net, and it's quite interesting to compare the opinions re these two models. It looks as if both of them have a lot of similarities: quite a few very happy users (many 5/5 ratings), a significant number of very-unhappy current/former owners (several 0/5 or 1/5 ratings), and some rather unflattering things to say about the quality of the manufacturers' customer service.

The quirks seem quite different (sub-par AM selectivity in the ICOM, glitchy behavior in the Yaesu), with fixes for many but not all of the quirks having been worked into current production-line models.

I get the feeling that in buying this sort of gear, it's a good idea _not_ to buy anything which is in the first year or so of its product lifetime... the manufacturers seem to take a while to get the bugs out of their designs. Buying from a local dealer with good after-sale support also looks to be important.

>> The VX-5 handheld could be my day-to-day mobile as
>> well, although it wouldn't be as convenient.
>
>You can say that again! Mine gets too hot to hold after a few minutes of
>normal QSO - great radio for quick check-ins but don't expect to chew
>the rag.

Yah - it's pretty clear that the user's hand is an integral part of the power-amp heatsink ;-)

If I do use it mobile, I'll probably put it in a dashboard holder, use a separate mike, and jack it into the roof antenna rather than use the rubber-duck. I could probably adjust one of the vent outlets to bathe it in cool air if necessary.

> Also, only 5 watts isn't enough in rural areas like my QTH and

>hard to change even squelch without one's undivided attention (Arrrg,
>look out for that truck!) Recommend spring for a good mobile like the
>FT-7100 or, better yet, the 706Mk2G.

Both the 706MkIIG, and the FT-100D, seem to take some criticism for an interface which a bit hard to use while driving (at least for complex functions). Is the FT-7100 better in this regard?

>I'm with "radiofun" on this part. Your van's roof makes a great
>groundplane for VHF/UHF and even a mag-mount in it's center will be
>better than anything way off center. For HF look into a "screwdriver".

Fortunately the cargo Aerostar has no headliner in the back - having
somebody drill through and install a threaded mount wouldn't be a
problem, and it'll be easy to route the coax on the inside.

I'm tempted to build something to allow the bracket to be mounted in
the back, and just run the mike cable and the front-panel detach cable
forwards. This would allow for a pretty short coax run to the
antenna... and there really isn't a terribly good place to mount a
mobile up front in this van anyhow, as all of the space is already
filled.

>That's why I recommend a mobile with a dedicated squelch knob that can
>be adjusted without having to take your eyes off the road.

Check.

>Try some QSOs before doing anything. Much of your "problem" may be your
>radio. My VX-5 has a *very* sensitive squelch. The RF from the AC here

Hi all!
I purchased (about 9 months ago) a Yaesu FT-100D (with seperation kit), the FC-20 auto-tuner and the ATAS-100 screwdriver antenna for a project I'm never going to get around to. And now I have the hots for a FT-817 and associated goodies.
So, if anyone is interested in the mint setup described above, and wants to buy it, or swap for it, email me at snelson@kay-com.com.
I should ad that the rig and tuner have been used about 5 or 6 times (not over 5 wpm!), and the antenna never.
Thanks!
Sam, WA5VDM

I'm strongly considering the purchase of Kenwood's HT TH-F6A, but I'm concerned about the unit overheating and reducing its power output.

Has anyone experienced a problem, under normal use, of the TH-F6A reducing its power because of its lack of heat dissipating ability (since it's plastic)?

Would a metal case be much better, such as ICOM IC-T7H?

Or is the difference between plastic and metal not a noticeable difference?

Thanks,

Jake

To late! My S10 Blazer just turned over 100K miles, and so far it has been perfect. Never a breakdown or major equipment failure (other than a new battery, belts, shocks, brakes, and an alternator) , uses about a quart of oil every three months, and it still gets 20 mpg with the big Vortec V-6... (and my FT-100 and ATAS fit in it fine and work great).

From: allanstern@aol.com
Message-ID: <20020419010152.08009.00004056@mb-cr.aol.com>
Source record: 44468

ITEMS FOR SALE

BC9000XLT: Base Model; 500Ch; 20Banks; 25-550 MHz, 760-1300 MHz; Data Skip; AM/NFM/WFM Mode Switch; Adjustable Step Width; Antenna Attenuator; Alpha Numeric LCD Display. Monitors both UHF and VHF Mil comms.
Recent EBay sale: $265.49 + ship.
Price: $190 shipped ($180 picked up). 4 units for sale.

BC895XLT: Trunk Tracker; Base Model; 300Ch; 10banks; 29-54, 108-174, 216-512; to 956 MHz. Moto TT; 100cps TurboScan; 300cps Search; Tuning Knob; Data Skip; 12 Priority Channels; RS-232 Cmptr port; Aux/Tape Output; Signal Strength Meter; Weather Alert; AutoStore skips dupes. Monitors UHF Mil comms. Recent EBay sale: $219.00 + ship, and 182.50 + ship. Current Grove price: $195.00 + ship.
Price: $135 shipped ($125 picked up). 2 units for sale.

My friend in Orlando, Harold McNeal, is selling six more scanners, that were not on the previous list I posted. These are Mil Comms capable, and two are Trunk Trackers. They are in top, like new condition. He has priced them low.
1. Price includes shipping to any CONUS address.
2. Price includes wall wart power supply or power cord.
3. Price includes manual and indoor antenna.
4. Radio will be shipped upon receipt of US Postal Money Order.
I prefer that you contact Harold directly, in Orlando, at 407/852-0693 (new number) to arrange to mail him the payment. If he is not at home, leave your number of call again until you reach him. I will be glad to answer any questions if you want to contact me at 321/777-2018.

Nope, it works FB, so far the best HT I have owned.

>
> Would a metal case be much better, such as ICOM IC-T7H?

Take the battery off of the TH-F6A and you'll find that the insides are
contained in a full sized cast metal chassis (heat sink)... only the face
cover and the battery are plastic. My TH-79A - which is metal - gets a lot
hotter during normal use.

Anything I have found at the computer stores are either preassembled cables or they dont use boots on them. They preassembled ones are molded right into the connector and are not removable. I am looking for the ones that are made for microphones. I am awaiting an answer from Yaesu.

Ok Guys...I hope this helps. I too just picked up a 2002 S-10 and have a Yaesu 7100m. Here's how I mounted mine: It sits on top of my dash just above the air duct.

I put the mounting bracket on the radio, then cut two pieces of aluminum about 1-1/2 inches wide each. Then bent them in something like a half circle on one end, then mounted them to the bracket with a sheet metal screw, this was done so that I could slide the ends of the metal into the top part of the dash above the air condition duct, there is enough give in the panel to accomodate this. The radio just sits there not screwed into anything, and can be removed at will with no marks or holes in the truck.
I made the metal strips about 6-7" long. Hope this helps...good luck, it works great for me...

Jim

5168. OptoElectronics 'Cub' thoughts?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-19 10:00:50 UTC
From: "Joshua C. Bergeron" <jbergeron@closedbsd.org>
Message-ID: <mVRv8.41764$%A.3719594@news1.west.cox.net>
Source record: 44473

I was considering a frequency counter for use with scanning. I just want to be able to walk around and see what frequencies are transmitting near me, and help to bring a little more fun into my hobby.

This is the one I was considering purchasing:
http://store.yahoo.com/optoelectronics/cub.html

Have any of you used this before? Does it work well? Any other recommendations for cheap frequency counters?

Thanks,
Josh

5169. Antenna tuner for SW broadcast receiving?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-19 10:30:19 UTC
From: Alan Beagley <abeagley@optonline.net>
Message-ID: <3CBFF1BA.BCC77D63@optonline.net>
Source record: 44474

Do any of the "automatic" antenna tuners permit manual override for use on SW broadcast bands? -- for receiving only, of course.

Most (all?) of them seem to depend on being able to transmit a low-power signal on the frequency in question.

I do not think it humorus when i buy a radio and was told that it works fine
when it don't.
And have too have it fixed then try and get my money back out of it and
people say stuff in the news group so it make's people think some thing is
wrong with radio.
I see it for $899 at the stores right now.

Yes, one or two dealers' Web sites do still quote $899.xx for the
IC-706MkIIG -- but many others refer to the $20-off coupon good through
May 19 (the last day of the Dayton Hamvention), bringing the price down
to $879.xx. Further, many of those dealers say that $899.xx is the
lowest price that Icom will let them *advertise*; they then invite
telephone or email inquiries for the real price. One of those dealers
quoted me $839.

On top of this, there is a coupon (valid through June 30, just extended
from March 31) to return to Icom for a free RMK-706 "Separation Kit"
(normally selling for up to $70) for remote mounting of the transceiver
in a motor vehicle.

In short, I do not like your chances of getting your asking price unless
you encounter somebody who has failed to do his or her homework. The rig
you are selling is precisely the rig I am planning to buy, but I am not
going to buy a used one at your price.

I am sorry that the rig you bought did not meet your requirements, or
was truly defective or misaligned. Perhaps you need to lean on the
vendor or on Icom.

Please if you have questions or want to make a trade contact me off list at my e-mail address.
gundoc@iglou.com Some of these lists are not swap lists and only tolerate my post because it is only once a week. To the group owners thank you for letting me continue to post to the group. I have had requests to put spaces between the radios on the list so I am going to try this on this list. Let me
know what you think.
Dean

GE Portables

GE MPA VHF 146-162 full system keypad. Radio is as new and is almost perfect. The only flaw is the grip tape under the PTT button is peeling at the edges. Otherwise perfect. The next feature is, The radio is Key pad programmable. 16 channel scan and front face programmable. Has a like new battery and a good rapid charger. Also a belt clip. $500.00

GE MPA VHF Select 157 - 174 split. Nice radio 9 condition with battery and standard charger. I have it programmed down to 154 MHz with no trouble but will go no lower. $200.00

GE MPA UHF Scan 440 - 470 192 channel scan. Radio works great. A little paint wear on the edges but I have seen worse. With charger and battery. $225.00

GE MPD UHF select model 440-460. 48 channel alpha-Numeric display. programmed on the 440 ham band and works on the local repeaters and GMRS. With Battery and standard charger. Nice 8 - 8.5 radio. $100.00 Also have 1 in about a 7 condition $90.00

GE MPD select model 470.- 488 MHz. 48 channel Alpha-Numeric display. With battery and standard charger. 7-7.5 $90.00

GE MPD Scan UHF 440- 460. 48 channel Alpha-Numeric display. Also programmed on the hamband for testing. Works on the local repeaters and GMRS. with battery and standard charger. $125.00

GE MPD scan VHF 150.8 174. 48 channel Alpha-Numeric display. These look good and come with a battery and standard charger. 135.00 each.

MPD Voice Guard VHF system model with full keypad. 48 channel alpha display. with battery and standard charger. $140.00

GE PCS UHF 8 channel. I have this radio on the uhf ham band for testing and it works the local repeaters. with battery and charger. $95.00

GE PCS VHF 2 channel 150 -174 split. Like new condition with battery, pocket charger, and leather case. $100.00 each (5 available)

GE MPS VHF Like new 10 channel. With new battery, new antenna, and a standard charger. $65.00

GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00

GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $225.00 all 3 radios.

GE Monogram VHF 10 channel portable. 157-179 split. ex CSX radio. I sold this radio a year ago but have taken it on trade. Condition 8 with belt clip and charger. I had this radio run for stolen from CSX by a local CSX Special Agent when I first bought these in a lot and was told that it had been sold at salvage. Perfect for a RR Museum or shortline on a budget. This could also be programmed for marine frequencies. Like new tall
Battery. $100.00

GE Mobiles

GE Phoenix SX VHF 128 channel scan. No accessories. Has all 8 proms. $100.00

GE MVS UHF 16 channel scan. With Mic, Bracket, and power cord. $125.00

GE Mastr exec II VHF 75 watt mobile complete with accessories. $60.00 each

GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each

GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00

.GE Ranger VHF 150.-162 100 watt mobile. Complete with cable, Mic, speaker, and S550 control head. This is a great public safety mobile or can be tuned to the 2 meter ham band. $175.00

GE S990 head. Looks new but I have not had time to test this yet. $75.00

GE S550 head 16 channel looks good but not tested. $35.00

GE Mobile Vehicle Adapter For MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com) With mic, speaker, and power cable. $100.00

GE Accessories

Mastr II control cable. $8.00 each

Mastr II head for mobile repeater operation. $5.00

Mastr II Mic. $5.00

Mastr II 8 channel tone boards. $5.00

Mobile Repeater cable for Mastr II. $10.00

Mobile Repeater cable for Delta or Ranger. $30.00. I have seen programming cables made from these.

GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2. If you buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.

GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each.

GE Delta cables. These are the downloading type used with the S820 heads. $40.00 each

Delta mounting plates. $10.00 each

Ranger mounting plate. $15.00

GE S-550 / 500 and others mounting brackets. $5.00 each

GE MPA, MPD, MTL public safety mic. $35.00 each

GE MPA, MPD, MTL standard Speaker mic. $25.00

GE PCS Universal Rapid charger. $35.00 each

GE MPA standard chargers. $20.00 each

GE MPA Rapid chargers. $30.00 each

GE MPI desk charger with wall transformer. $10.00

GE MPI Rack charger, 8 position. 25.00

GE MPI Mobile battery charger, Rare. $20.00

GE Battery discharger analyzer. For MPA, MPD batteries. Attaches to a rapid rack charger with a DB 15 cable and uses a MPD body to attach a battery to. Has LED readout in display area of MPD body to tell discharge rate. Another rare GE goodie. $45.00

GE shoulder strap like new, attaches where belt clip is. $15.00

GE Belt clips. $10.00 each

GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card and power supply / speaker. $300.00

Other Radios and Accessories

Motorola Saber III VHF 146-174 split. 120 channel Alpha-Numeric display with secure - net module. (no out of country sales) des I think. I have been using this all week and talking on the ham band to test this radio. Battery has lasted all week during drive time so it seems good. With rapid charger and big battery. $500.00 or trade for a VHF MRK II

Icom 3200 a Dual band ham radio. Has box and manual but no mounting bracket. Has tone squelch board installed. $205.00

Icom IC 24-at Dual band Portable. In good shape, Display has no scratches and only 1 small patch of the paint is peeled off of the back of this radio. With manual and wall charger. $170.00

Maxon 5050a Low band portable pair. Like new condition with 1 battery charger
but I will split up the pair if someone wants 1 radio only. 6 channels programmed
for 10 meter ham band on 2 repeater pair and 4 simplex frequencies.
2 radios and 1 charger $195.00

Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland. $75.00

Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00

Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00

Motorola Mitrek VHF high 110 watt drawer only. $50.00

Motorola Adapter for MX radios for the 1801 suitcase programmer. A and B prom. $175.00

Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all

Uniden SMS 825 ts, 800 MHz Dash mount radio. $75.00

Voter from IMTS phone system. 2 rec and 2 tx cards. $40.00

Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00

Antenna Specialists on glass 440 antenna. New old stock. $22.00

Antenna Specialists on glass 220 antenna. New old stock. $22.00

Consignment section

This area is for a few friends who like those other radios you know

"Motorola" They are good people and I will pass along any trades you may wish to make.

Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete. $425.00

Motorola Maratrac VHF 100 watt 16 channel head, Never mounted in a vehicle.$375.00

Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each

Motorola HT1000 Intrinsically safe, Re-cased looks new. 16 channel scan with charger. $425.00

Motorola P200 UHF high power. 6 channel. $150.00

EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, anything you have extra. MPA or MPD portables what do you have and what do you want for them?
Johnson scorpion program cable. PSX200 UHF mobiles.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. If I think it may be bad I will not list it. I take cash, Postal Money Orders, Paypal, and checks but I hold them for up to two weeks to clear before I ship. If you have a question E-mail me.

So was, BTW, me to.

But, it is less than 1 week ago, I swore in about 45minutes without
repeating myself over a RCA male "connector". That is even more than
I usually swear over those "wonderful" banana-plug replacement YECCH-,
pardon, UHF connectors.

Just wait 28 more days for the 2002, 50th Dayton Havention.

Last year at Dayton, they where selling "BRAND NEW"
IC706MKIIG's for $729 on Sunday.ï¿½ I can't imagine
how LOW they will sell them for this year; but I bet it's
around $600.ï¿½ That's where I'll be picking up my BRAND
NEW IC706MKIIG this year.ï¿½ Just in time for Field Day.

May be I should pick a bunch of them up for $600, and than
turn around and sell them on e-Bay for like $850+.ï¿½ Could
make a nice $250 profit per unit.....

5176. Problem with IC-821H and PL tones

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-19 14:52:48 UTC
From: david.f.jenkins@usa.net
Message-ID: <b0c722a6.0204190652.2751ef24@posting.google.com>
Source record: 44481

Having the following problem. It takes a little explaining, so bear with me.

In repeater operation, I am unable to hold our local repeater open (it requires a PL tone of 100.0). [The repeater, BTW, is also an Icom - old one - don't know the model, though.] When I transmit, it will bring up the repeater, but if I continue to transmit for 3 or more seconds (or so), I lose the repeater. If I call a friend simplex (not on the repeater frequency), and he sets his tone squelch at 100, and I set the 821's transmit tone to 100, he can hear me just fine, no matter how long I transmit. Furthermore, I can hold other repeaters open with a tone of 100, just not ours.

At first blush, this would lead one to believe that our local repeater has a problem, but the repeater works fine for everyone else's radios (including a couple of mine). And get this: if I set the 821 transmit tone to 97.4, I can hold the repeater just fine. If my friend sets his radio to a PL of 97.4, he brings up the repeater and drops it repetitively on long transmits.

To summarize: I'm the only one having this problem. I can hold the repeater (whose squelch is set for a tone of 100) only if I set the transmit tone on the 821 to 97.4. On other radios, 100 works just fine.

So, here's some questions:
1. Is there a pot or something that can be used to adjust the output tone?
2. What do you recommend as the best way to diagnose this problem?
3. Any clue as to what's going on?
4. My hunch is that the 821's tone is a little high, and the repeater's tone squelch is set a little low - what do you think?

Any help would be greatly appreciated.

Sorry to hear that you had bad luck with Chevy S-10's. I've owned
three of them. Never had the problems you describe. I've had a
1987, 1992, and presently a 1998. Probably in another 2 years or
so, Ill buy another one if they are still made, most likely in 2004.

Regards,

James

I mounted my Yaesu FT-7100 on top of the console under
the dash in my 1998 S-10. I don't smoke so it doesn't matter
that the ash tray can't be used . Haven't looked at the 2002's.

I must be mighty lucky. I've had nothing BUT Chevrolets for 30 years and 1
Buick, and I
have never had anything but good luck with them. I've got an '87 Celebrity
wagon with
199,000 miles on it (died due to spark plug dropping an electrode down in
the engine and I
plan to fix it because it is just too handy and economical to just scrap)
and a '93 Lumina Z34. The old wagon's engine or tranny never had a wrench
on them except for routine maintenance until that unfortunate incident, and
the Lumina has had a battery, 1 alternator,
and a timing belt since new. It has 90,000 miles on it. And I hope to get
another vehicle
soon. Yes, it'll most likely be a Chevrolet.

A common misconception... UHF (the connector) does not mean Ultra
High Frequency, it means Universal HF, as in "good for all uses
between 3 and 30 MHz". Of course, the definition of 'good' is
debatable in this case.

As I recall the story, N, BNC, TNC, and C were all designed by the
same two guys, Mr. 'N' and Mr. 'C'. Sorry, can't remember their
names or where they worked (Bell Labs?). Perhaps someone else does?

I've never had any trouble putting N connectors on. Keeping them
on...thats another story, at least on cable with braided sheild. They
can not stand much flexing. If you are using one on a rotating
antenna, make sure that you have the cable clamped so there is no
movement what so ever at the connector.

5186. Re: Effects of under driving FL2100B?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-19 18:42:48 UTC
From: Caveat <caveat@poster.com>
Message-ID: <b4n0cu8186ri790flvog5lsfvmn51dj0n8@4ax.com>
Source record: 44491

I've been running a 2100B off and on since the late 70s. Out of respect for its age I've been under-driving it for the past couple of years by simply cutting back on the exciter drive until the output is 300 or so watts out on ssb peaks on 10 meters. Never tried it on PSK.

The amp is unbelievably tough, and tolerates abuse well. It will even load into a badly mismatched antenna--although of course that isn't recommended. It's very reliable and predictable, even in its dotage

I would suggest tuning it at the lower output because the load and plate settings are slightly different than at full power. Others may take issue with this suggestion, and opinion also varies on whether it should be tuned for min plate current at whatever drive power or peak power output at that same drive level . I do what makes the amp most happy, which in my case is peak power out. YMMV.

The 2100B previously always ran hot at full rated output and a good indication of driving it too hard is how red the 572B plates get when operating. Keep an eye on them. I added an exhaust fan on top to run the amp cooler, and now with lower power out and a near-perfect antenna match the amp runs cool as a cucumber. A fine machine.

Good luck,

Caveat

Why get an auto-tuner if you plan to adjust in manually? There are many manual tuners available that will do the job for a lot less money. If it will only be used on receive, you don't need one that is capable of passing power. In fact, you could easily build one with small parts.

Motorola MCS2000 Model 2 - FLASHport - 806-870 MHz - NO RESERVE!

You are bidding on ONE Motorola MCS 2000, Model 2, FLASHport, 800 MHz, 35Watt, Privacy Plus Radio. This radio has the H38/G51 (Smartzone Operation) Flashcode installed. It operates in the 806-870 MHz range on Type I, II, IIi Systems and in conventional modes. It is capable of up to 160 Talkgroups and Conventional Channels combined -- on up to 20 Systems. The model number is M01UJM6PW6AN. Included in this auction is a palm mic, speaker adapter, and speaker (with speaker bracket). No other cables or parts are offered. This unit works great. I currently have it programmed on City Police, but will have to blank it for security reasons. There are NO scratches in the display. This unit is a 9.99 out of 10. It has small scratches near the rear of the unit where the unit was opened and checked out by an authorized MSS. This model is a dash mount, but it is capable of being converted to a remote mount with the purchase of a remote mount kit (about $160 new). Please refer to Motorola's web site for more details and features of this radio. This model lists for $2500 new and possibly more for the H38/G51 Flash options.

Source record: 44497

Drill a hole in the roof and mount the antenna there (you may not get a solid ground through the door). Then buy a used 2 meter mobile ($150-200) and mount it in the van. Make sure both are grounded good. You will get noise ignition/alternator noise from the strangest items. I do know that a good, solid, connected **ground** will help keep the interference to a minimum.

Every other time I keyed my HTX-100 (25 watt) radio (mounted in a 1989 Dodge pick-up) the wipers would come on. I never did figure out how to fix the problem...

An FT-100 "may" be more radio than you need. Then again, I was going to buy one until I read about the problems other owners were having.

Source record: 44398

I am going to be using the transceiver for transmitting (when the FCC issues me my callsign), and the automatic antenna tuner will be very useful for that. But I want to use the rig for SW listening as well.

One of the vendors of the Icom rig I am probably going to buy has informed me that disabling the autotuner merely stops it autotuning but does not bypass it; it simply remains at its previous settings. As somebody has pointed out elsewhere, perhaps the simplest way to use such a device for listening to SW broadcasts is to let it autotune on the nearest amateur band to the broadcast frequency of interest.

They were designed by Paul Neil and Carl Concelman of Bell Labs. The BNC is a 'Bayonet Neil-Concelman', and the TNC is a 'Threaded Neil-Concelman'. And yes, the Type-N and Type-C connectors come from the first letter of their last names.

The IC-AH4 (for random-length wire antennae) and AT-180 (for coax-fed antennae) work with the current IC-706MkIIG. I'm not sure about the earlier IC-706 variants.

Icom makes a couple of auto-tuners. See their web site.

Also see the web sites for LDG and SGC. They make nice auto-tuners that will work with any rig, Icom or otherwise. They might be a little cheaper than Icom.

Dittos too!

I avoid soldering PL-259s at all cost unless it's on Teflon coax.
It's just too much hassle and melts the plastic! I find it easier
to do N, BNC clamp or else crimp.

Anyone who would rather fall back on a PL-259 just doesn't
know any better and should be pitied.

The only good reason for using a PL-259, is because too many
radios have SO-239s, but many of mine have BNC Fem to Pl-259
adapters so that I can quickly make changes. Have had no trouble
up to 100 watts in regular usage. It is sensless to me how many
rigs used even Phone jacks on rigs. My Heath HW-2036a got
a BNC fitting before it was even finished!

Haaaaaaaaaa! This is how the engineering staff justifies putting
an ATU network in your ham rigs! So that you can tune out the
SWR hump in your PL-259/SO-239 junction out to the antenna.

I have seen weirdness when tuning infrastructure, where I get
apparently more power out of the other end of the coax or out
of a duplexer, and different readings with different coax jumpers
with PL-259s! Instrumentation is meaningless until you do away
with them.

"Roy Lewallen" <w7el@eznec.com> wrote in message news:3CBF5AA0.808D2AA7@eznec.com...
: Was the insertion loss due to mismatch or to actual dissipative loss? If
: it's mismatch, the "loss" can be eliminated by a matching network.
:
: Here's an example to show the difference. Suppose the connector is right
: at the load, and that the generator is set up to provide 10 volts RMS (2
: W) to a 50 ohm load. The generator voltage is then 20 volts RMS. If the
: connector's impedance at the test frequency is a resistance of 12.2
: ohms, the load will see 50/112.2 * 20 = 8.91 volts RMS, a reduction of 1
: dB from the 10 volts it would have gotten without the connector. If this
: is happening, the connector loss is truly 1 dB, and the loss can't be
: recovered. But on the other hand, suppose that the connector's impedance
: is a pure reactance of 50.9 ohms. The load will see 100/(sqrt(100^2 +
: 50.9^2)) = 8.91 volts RMS just like it did with a resistive connector
: impedance. So the "insertion loss" is 1 dB, just the same as for the
: resistive connector. But this is different. We can make the insertion
: "loss" disappear entirely simply by adding a series reactance of the
: opposite sign at the connector. This cancels out the reactance, and the
: load gets its full 10 volts RMS (2 watts). This second case shows the
: effect of, and cure for, the impedance "bump" caused by a connector that
: doesn't have the correct constant internal impedance. In many cases,
: you'll have a matching network anyway, so you can adjust out the effect
: of the impedance bump with minimal degradation to your system. (The only
: possible degradation is a slight increase in the SWR on the transmission
: line, if the mismatch is at the antenna and the matching is done at the
: transmitter. The increased SWR could lead to increased loss if the line
: is quite lossy to begin with and the SWR increase is appreciable.) A UHF
: connector with Teflon insulation isn't likely to have much resistive
: loss -- measured "insertion loss" is more likely due to impedance
: mismatch.
:

: "Insertion loss" is similar to the concept of "mismatch loss" or
: "reflection loss". I recently wrote about those in the thread "Suggest
: coax for long run" in rec.radio.amateur.antenna, on March 27 and April
: 10. You should be able to find these at http://groups.google.com. There
: was also some discussion recently about misapplying modeling results to
: reach invalid conclusions. If a measurement is made of a connector's
: "insertion loss" and it's taken to imply that it represents real
: dissipative loss, then this could be a good example of that
: misapplication being done.

I commend you on owning one of the finest VHF/UHF fixed stations
known to man, you don't see many for sale on the net and I expect
that is because those that own them will not let go of them.

In my mind David you have hit the nail on the head. The CTCSS
tone encoder is a bit off. The techs at icom sometimes will send you
information via the internet as to which pot to turn to align it.

The last time I sent mine in for service, I sent it in to have backlit
display lights replaced, I had them align all tone boards etc and was
having a similar problem to yours. Mine was on a UHF machine also
on a tone code of 100. Once I got it back from ICOM after the bulb
replacement and alignment I did not have the problem again.

I don't guess I was much help but I always enjoy talking to another
821H owner.

Hello Helmsman,
I use a TS450S/AT also. If you are referring to the Kenwood DSP-100 it is primarily designed for transmit audio tailoring. I looked into them at www.eham.net in the product reviews and as I recall all the owners said there was no noticeable improvement in the received audio.

However what I have found to be extremely useful and very easy to use with my TS450S/AT is the ClearSpeech DSP Base Unit. It works tremendously well on -all- modes especially when I work AM. Here is a link to the ClearSpeech Base Unit Page on my site. There is also a link there for the ClearSpeech base Unit homepage.

I have a total of 5 units of these main frame sweepers
Kruse Systron Donner RF Sweeper Model 5000A. Working Unit. Features include: Adjustable Horizontal Sweep Speed 0.01 to 10 seconds; Horizontal output, Manual Trigger; Adjustable Start, Stop and three Marker Frequencies; Rear Panel connectors for external Sweep, external trigger, external AM modulation, sweep output, blanking output, marker output, 1KHz output; Selectable 115 or 220 VAC input. Designed to work with Model 5xxx RF Oscillator Plug-Ins. $125 each all 5 for $500 Plus shipping

Kruse Systron Donner RF Oscillator Model 5011. 1 - 2 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe $125 plus shipping

Kruse Systron Donner RF Oscillator Model 5014-9. 6 - 8 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $125 plus shipping

Kruse Systron Donner RF Oscillator Model 5015-2. 7 - 11 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $125 plus shipping

Total of 1 each of the plug-ins

Pictures available for all above by e-mail

5228. Looking for older Field Day logging pgm. DOS + KISS

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-20 17:55:33 UTC
From: Allodoxaphobia <QSB@QRM-QRN.net>
Message-ID: <slrnac3asj.5di.QSB@animas.frontier.net>
Source record: 44432

I'm looking for a Field Day logging program. I'd prefer DOS-based,
and the file format is not of any particular concern -- I can write
a post-contest filter to re-jigger it as needed.

I don't need networking -- our's is always a 1A or 2B op.
All I need to log is Call, Class, and Section. I don't need
Grid Squares, 10-10 #'s, IOTA #'s, or QCWA #'s. HI!HI!

I'll be google'ing the web for this. But, I'd like to hear
comments and recommendations.

TIA es 73

That approach will probably work OK as long as the SW and ham bands are close in freq. When you have a significant difference (say 6 MHz SW, or the tropical freqs, etc) the mismatch may cause significantly WORSE reception than not having the tuner in the line. There should be a way to BYPASS the tuner, take it out completely, and have the antenna come directly to the rcvr.

Forget the UHF, they are crap. Use the N, it maintains the 50 ohm
impedance through the connector as best as anything. Be as anal as
possible about the installation of the connectors. Wrap them with
monkey shit and tape when done.

C'mon folks, let's get serious, and practical!

Is a Type N connector better than a UHF connector? Yes.

But, what are we connecting this cable/connector to? An antenna, which at best has a 2:1 VSWR over the frequency range of interest. That is, it may look like 25 ohm, or 100 ohm, or any combination of resistance and reactance which results in a 2:1 VSWR. And if the connector adds a VSWR of 1.01:1, or 1.1:1, or whatever, to this, you're never gonna see any effect, positive or negative! Yes, the UHF connector could actually improve the match of the cable to the antenna.

And at the other end, we have a receiver or transceiver with a "50 ohm" impedance. How close to 50 ohm is it? Do you really believe the receiver/transceiver is a better match to 50 ohm, over a broad frequency range, than is a UHF connector? If you do, you're living in a dreamworld!

A much more important consideration should be things like:
water tightness; is the end of the cable well sealed against water intrusion?

mechanical; is the flexing of the cable going to result in loss of electrical or mechanical integrity?

Now, there are places where the effect of the "betterness" of a Type N connector may be seen. In connecting, for example, multiple lengths of cable through 2 connectors and a nipple, it is good practice to use the connector, and nipple, which have the better match to the cable impedance. That may very well be a Type N, or Type C, rather than a UHF connector.

But, when connecting a cable to a totally mismatched antenna, or receiver, let's use a little common sense. You could even use one of those infamous RCA plugs, and not see any observable difference in performance.

Walt (with 50 years of experience in RF/Microwave measurement technology)

Up through the 10 meter band, no two ham bands are more than 4 mhz apart, which means there will always be a ham band within 2 mhz of any sw broadcast station. Unless the antenna tunes very sharply, I can't imagine that being 2 mhz off will make any difference, to the ear.

Frankly, I don't know many swl'ers who are able to tune their antennas precisely onto each and every station they listen to. Most use fairly broadbanded antennas, or just random wires or whips.

Somebody who owns the models of transceiver and antenna in question
informed me that the information from the vendor is incorrect: switching
the autotuner OFF does BYPASS it -- and this is confirmed by the on-line
manual I was able to find.

I have a nice Hammarlund HK-1B solid state keyer for sale. This rare unit is complete, un-modified and in good working order. It comes with a fresh 22.5v battery and the original manual. The HK-1B features "hi" and "lo" keying at 8-50wpm and has a built in side-tone oscillator. The price is $100 and will pay for UPS ground shipping.

You can view photos of this keyer by following these links:

Source record: 44446

Most of the SW broadcasts are in a part of the spectrum (i.e. below 10 meters) where the receiver is limited by atmospheric noise. If the antenna is not resonant, the signal will be lower but so will the noise level. The result is that you end up with about the same signal to noise ratio and can't notice any difference in the ability to hear the station between a resonant antenna and one that's quite a ways off.

Let's get practical, just solder the coax to the antenna, that is the
best connector.

How about RF shielding? N connectors have far better shielding than a UHF connector. Probably not critical on your 2m radio in the car but in our repeater buildings on top of the mountain, you'll find nothing but N connectors on all of our microwave racks and Trunked Radio systems.

I had one and wasn't impressed by its CW performance.
It's semi-break-in operation was clunky.

For much better CW rigs on a budget, check out the Ten-Tec
Omni-A/B/C/D series. They offer superb filtering and excellent full
QSK. All accessary filters are still available from Ten-Tec.
Plus they are all solid state. The 6146 finals in the TS-820 are
starting to get expensive. You can get the Omni A, or Omni-D, version
B for around $200 plus a 12 volt power supply.

73,
Doug

5249. FS: Homebrew AM Transmitter & Some Mics

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-21 10:48:37 UTC
From: Sidevalve <Sabbatai_zvi@hotmail.com>
Message-ID: <u965cusl7njsgv1pdh6j9f9v3k9sn2mufa@4ax.com>
Source record: 44354

FOR SALE:

Homebrew AM transmitter with 1625 final plate modulated by a pair of
5881 tubes. Made from a nicely modified ARC-5 transmitter - conversion
job. Has an older style 4-pin mic input, gain control etc. etc.
Appears to be made for 40m and has final tank of 17 turns silver
plated copper 16-18 gauge wire on a 2" diameter ceramic form.
Picture available on request
Will sell for $25.00 without the two 5881 tubes or for $35.00 with
them. Shipping additional.

Shure 444
Desk mic with PTT bar and locking switch. The best sounding mic for
SSB on the older Drake 4 line equipment. Excellent for use with older
tube type transmitters
Picture available on request
Will sell for $29.00 plus shipping

Turner 250 Desk microphone - beautiful silver case with PTT bar and
locking switch for those long transmissions! Excellent match for all
of the old 'boatanchor' AM and SSB rigs.
Picture available on request.
Will sell for $29.00

Shure 202 Mobile microphone - gray, sharp appearance with PTT,
excellent condition.
Picture available on request.
Will sell for $25.00 plus shipping

Icom mobile microphone, low impedance, black -
Picture available on request.
Will sell for $15.00

Heathkit mobile microphone, low impedance, black -
Picture available on request.
Will sell for $15.00

5258. Why is my CW audio so high pitched?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-21 15:54:09 UTC
From: cprstn54zz@att.net
Message-ID: <3cc2dd08.44902171@news-server.optonline.net>
Source record: 44362

When receiving CW on my FT990, I get the strongest (S-meter) and loudest signal when the tone I hear is around 1500Hz. If I try to tune for a 700Hz tone, the signal is inaudible over the QRN. I have no optional internal filters installed; only the standard 2400Hz. Is this performance normal?

This creates a problem with my outboard digital filter, which works well to extract the 1500Hz tone, but is a brick wall to the FT990's 700Hz side tone. Thus, I can't hear my side tone on transmit, unless I bypass the DSP. I know it is not my hearing, because the DSP also can't find weak signals when set to 700HZ, whereas it can find then when set to 155Hz.

Does that rig have an IF shift or passband tuning? If so ,you may need
to adjust the passband for the tone you want. It may be set "nuetral"
for ssb. MK

Bruce,

You mentioned you were fixing Mororola stuff to this NG awhile back.

I saved your msg but the only email address it contains is some antispam
alias.

If you're still out there please reply to *me* <vito@crosslink.net> with
an address that works.

TIA
K3DWW

Well, anybody who lists a real e-mail here is walking around with a sign
that says SEND ME SPAM.

If you did a quick check with Google and looked up a back post you'd find a
URL to his business, http://www.bluefeathertech.com/ and by clicking on his
name that's underlined you'd quickly come up with:

kyrrin@bluefeathertech.com

Sometimes a few seconds of thought will save frustration.

> I hear back while I am still young.

I'm trying to remember which rig that is...I'm confused with it and
the ft-900??. Of the two I'm thinking of, one is like a budget
ft-1000? and is a big radio, and the other is a small mobile rig with
attachable accessories. I think this must be the one you have..DSP,
etc. I would think it would have something , but maybe not being
small...Both my icoms have IF shift. On the 706g the best setting for
CW is different than what you use for SSB. "nuetral". I'm wondering if
maybe they are doing some audio filtering. If you have no CW filter,
you should still good down to a fairly low frequency as far as the IF
filtering.
The stock SSB filter should be fairly broad and flat overall. They may
be using audio filtering when you change to CW that peaks at a higher
frequency than you would like.?? Maybe it's adjustable?? I guess the
yaesu guys will tell you... MK

I went back to basics. "SHIFT" -- an adjustment I thought was not
used unless a button was pressed -- is actually effective all the time
and was all the way to one side. Moving it to the middle lowered the
pitch of the CW received to the range I want. Thanks for your help.

5299. Re: UHF OR N CONNECTOR?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-23 00:59:10 UTC
From: Terry Bullett <tbullett@charter.net>
Message-ID: <3CC4B1DE.B4DF40F7@charter.net>
Source record: 44304
Cross-posted to:
rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.space,rec.radio.scanner

I use N type connectors exclusively in my HF work. I also prefer crimp type connectors, vice the solder variety.
While it is possible to get a better solder job than a crimp job, it takes less skill
to do a decent job with a crimp tool. I've seen way too many hack jobs on solder connectors to begin to count 'em. And believe me it's a hell of alot easier to replace a crimp connector when it's still pitch dark at noon, there's a 20 knot wind and the temp is dropping below -40. This makes you glad you shelled out the extra bucks for a crimp tool instead of a propane soldering iron!

As for RG-9913, it is lower loss and cheap, but BEWARE
- It's easier to cause physical damage on this cable
- Water gets into the cable through the connector, penetrates the spiral dielectric
and turns the last meter of the cable into a gelatinous dummy load. A tiny bit of silicone RTV at the end will prevent this headache.
- Of course it needs a different type of connector than RG213

5301. Icom 706MKII Mic Gain increase

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-23 01:52:40 UTC
From: Scott Hilton <n0oba@attbi.com>
Message-ID: <I73x8.109580$CH1.95841@sccrnsc02>
Source record: 44306

Does anyone know how to increase the mic gain other than on the radio itself with the dial. I know the 706 original had a mod, is this the same for the MKII. It says to change a resistor value but I can't find it on the radio and I thought I've looked everywhere. My serial # is 1564 and was one of the early ones. I can't find the Resitor that the 706 mod shows on the internet. Does anyone know where to find the resistor and on what side of the radio it's on? Does it work after the mod? Thanks for your help in advance.

I have also received several of these, which Norton reported as:

This file: "install.exe" was infected with the: "W32.Klez.E@mm" virus.

NAV notified me, and ended up quarantining it every time. Well worth
whatever I paid for the Norton Systemworks.

Happy trails,

If a person has bothered to utilize a effective virus scanning/cleaning program, there should be little fear of that. Have it quarrantine the program or remove it totally if concerned. So far, knock on wood, I have yet to be hit with a virus.....

I would like to buy a 12v power supply for running a 2meter
mobile rig in the house. I want something inexpensive.

The rig runs less than 8 amps at hi power, so 10 amps continuous
would be the perfect rating. It needs to have a front power
switch. A cigarette lighter plug on front would be a nice plus,
but not required.

I live in San Jose, CA. If you live nearby, that is a BIG plus.

I am also a tightwad. I want to spend about $40 tops. If
you think your used stuff is gold-plated, don't bother to
contact me. If you want to comment about me being too
cheap, don't bother to contact me. Let me just agree up
front: I am too cheap. Now you don't need to tell me.

If you have a decent working power supply that is not
too terribly butt-ugly for under $40, THEN go ahead
and contact me.

My email is lark@t4z.com, except that you must
change the 'l' to 'm' and change the 'z' to a 'p'. This
is to avoid getting spammed (any more than I already am...)

FOR SALE:

Kenwood TR-2500 handy-talky 2m FM rig.
Comes with original manual, PB25, PB 26 battery packs, alkaline pack,
MS-1 mobile charger, ST-2 base drop-in charger and WO-3 plug-in 120V
charger. Needs new lithium back-up battery. Will sell for $30.00

Also have the Kenwood SMC-25 speaker mic for $15.00 or sell for $10.00
with the above rig.

http://www.mods.dk/pictureselect.php3?radio=kenwood&model=tr-2500

Also open to trades for interesting ham gear and/or parts etc.
Such as a memory keyer, or older tube equipment.

That could well be true, but I have seen many more cables pulled out of
the connector with crimp-type connectors than with solder-type, especially
with BNC. I also think the crimp-type is worse in moist conditions.

(of course you want to protect the connector against moist and cable stress
in all cases)

I have a Dorrough DAP-610. Three band
compressor with peak limiter. It's been in the rack for a couple of years
here, unused. This was Dorrough's digitally controlled processor popular in
the 1980's.

Price? Problably around $400.

I heard somewhere that the SCS PTC-II pro wouldn't control some 706 models?
So it would be cheaper to add another serial port to the laptop?

Yep, thats it. Instead of being "nuetral" it was all the way to one
side. Even worse usually...I bet SSB sounds better now...Was probably
overly flat before. Or overly tinny and thin, depending which was it
was set. MK

hello,

i have for sale or trade a yeasu ft-107m hf rig. 100 watts all bands.
all solid state with digital readout. covers 80-10 meters. has two places on
the bandswitch to add the warc bands. this is detailed in the manual, which
is also included.

there is a problem with the memory board. you can not store frequencys
in the 12 memory slots. this does not effect the operation of the rig, you
just can't use the memories. face is very good. case is ok. no scratches but
the feet on the bottom are not attached and it is missing 5 of the 8 screws
that hold the top and bottom half of the case to the rig. i can replace
these, but i have just not gotten around to it. i have used this rig for
psk. power supply is included in the rig.

i would rather trade this for a nice swan rig, like a 750 or 700.
something with tubes in it so i can work on it. email me with what you have.

cash price $250.00 plus shipping. will entertain offers.

thanks

Has anyone succeeded in getting the above combination to work? I have not been able to get the Icom software to work since installing the UT-106. Scancat works fine with the combination, and Icom told me to run it in 95 mode, but that doesn't seem to work. Icom's last word was, well, it's not supposed to work in XP at all. Nice eh?

Appreciate any help anyone can be!

Thanks

Harry

Harry:
I had the same problem with Icom. The service people said the only work
around was to order third person software which I find totally unacceptable.
They have 32 bit software for the pcr100 how hard would it be to do modify
it for the PCR 1000. I just don't know
Maybe if we could get a bunch of use to email the home office in protest.

I've never heard of such a thing. I took mine to a company that makes
metal signs. They scanned the panel, powder coated the panel and
the case, then silk screened the lettering on that they scanned.
It was powder coat black with white lettering. It looked brand new
only black. The green knobs and the black go together.

Larry:

Just about a year ago, I had the same problem. The power amp (aka "brick" aka "module") had gone bad. It's a Toshiba S-AV17. About $64 from Consolidated Electronics in Dayton (over $100 from Kenwood USA in NJ). Easy to replace - cut the leads on the bad unit and remove the wire stubs - don't try to remove the module in one piece.

... Rich

Ray,

At one point, they were telling me to use 95 compatibility mode. That
didn't work, needless to say. I think I'll drop them a few more emails
and rally other people to do the same....good idea! Their final words
to me were that the software wasn't spec'd to do it. I think that if
Icom isn't making money on something, they don't keep going with it.
Some radio companies keep their software current, although they might
charge a small fee for upgrades at some point.....maybe after the
warrantee period is up. I know that's the case with some of AOR's products.

Just thought I'd post a follow up email on the 811H problem I had a couple weeks ago. I'd like to thank W6DKN, AB7SL and WA6LZH for their their helpful posts and emails.

The problem turned out to be the STBY/OPR switch that had failed permanently open. This was the last thing I expected would have failed.

Anyway, I isolated the problem with the assistance of those mentioned above and called Ameritron tech support to see if they would sell me a switch. Even though my unit is way out of warranty, they mailed me a new switch at no charge. It probably cost them all of $2 to do this as they told me the switch was only a dollar and some change. I thought it was particularly good customer service on their part. This is the kind of customer service that makes me want to return to Ameritron for my next amplifier purchase!

The amp is now up and running as new.

Thanks again,

Tim

Hi Guys;
I am never going to have the time required to play with these "gems", so I am selling them for less then what I paid.
1- 75A-4 receiver, 3.1/2.1/500hz filters, really nice. S/N 4xxx
2- KWS-1 w/4cx250a's, RF & Power supply with key.
3- Matching speaker for the A4, I think the Flocking may have been changed because it has a metal type grill, no, its not the big giant, tilt face speaker :-).
Original manuals for both, hose, 2 spinner knobs/1 cracked & epoxied but have the plain non vernier type knob also.
Pick up price on LI, NY is $3,000.
No pictures, come & see, you need to be local anyway I think.
Oh, the inside of the A-4 & RF deck look like new or close to it for being almost 45 years old.

It probably is something like what the others say.

But I have a different story. This happens to me periodically. I keep my power supply (Astron 50m) on the floor and the dog likes to sleep in the wires next to it. about once a month he'll knock the current limit knob over enough so that everything in the shack works (VHF and HF) until I go to transmit.

that is one common element -- power supply current.

5339. Grounding question

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-24 06:50:19 UTC
From: Alan Beagley <abeagley@optonline.net>
Message-ID: <3CC655AA.114F9F61@optonline.net>
Source record: 44345

I am planning to mount an Icom IC-AH4 automatic antenna tuner on the wall just outside a second-floor window, with its ground terminal connected to an 8 ft. copper-clad steel rod driven into the ground. I understand that this grounding rod has to be connected to the existing electrical ground (which is about 30ft away).

Now, what about grounding the transceiver? Do I run a connection from the grounding screw on the IC-706 MkIIG transceiver case to the ground terminal on the antenna tuner, or directly to the grounding rod, or to the case of the power supply, which is grounded through its 3-pin power cord? I assume that the shield of the coax from the transceiver to the tuner does not constitute a satisfactory ground itself?

Or . . . ?

(And, just to complicate matters, the VHF/UHF antenna will be in yet another location, with a connection to another grounding rod located almost immediately below it and also connected to the existing electrical ground -- about 20 ft. away).

Oh, and should these grounding rods be connected to the ground terminal at the service panel or to the water pipe to which the service panel's ground bus is connected?

From: Alan Beagley <abeagley@optonline.net>
Message-ID: <3CC657DD.7CCEBDBC@optonline.net>
Source record: 44344

I am planning to mount an Icom IC-AH4 automatic antenna tuner on the wall just outside a second-floor window, with its ground terminal connected to an 8 ft. copper-clad steel rod driven into the ground. I understand that this grounding rod has to be connected to the existing electrical ground (which is about 30ft away).

In the event of thunderstorms (or even whenever the equipment is not in use) I can disconnect the antenna feeders from the transceiver, but that leaves the antenna tuner itself in danger of being fried. Is there any alternative to removing the antenna wire from the terminal on the tuner and connecting it to the ground wire?

The ground wire is #6 stranded copper. The antenna will be constructed of much thinner wire -- #20 or less, with the intention of having it virtually invisible.

I'd just put a banana plug on the antenna wire where it comes to the tuner terminal, and yank the wire loose when the skies look dangerous. I wouldn't ground that loose wire, unless you want lightening to enter your station through your ground system.

Just made separate deals to acquire an SX-117 and an HT-44.
Now, I need the model PS-150-120 power supply / speaker to
complete the station. Prefer working, will take one that
needs minor repairs (caps, etc) as long as transformer is
good. Must be in good cosmetic shape, because the rcvr and
xmtr are. Whatcha got?

Hello,

Thinking about getting a Kenwood TS-2000 or a Yaesu FT-847.
Has anyone had the opportunity to use both of these side by side?
Any comments? Please only first hand user experiences. I have
read all the specifications already..

Thank You in advance

Jeff

RTFM! While holding down the monitor button,
the tuning knob allows you to select open, automatic,
level 1, or level 2...

Usually the manufacturer's website will have the manuals in PDF format.
Here's Icom's website: http://www.icomamerica.com/support/archive/index.html

If it's not on there, you can probably email them and request it.

5357. HF rig on a budget? Opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-25 03:53:20 UTC
From: senecal@mapson.cs.ucdavis.edu
Message-ID: <senecal-2404022053200001@d71-096.solano1.ucdavis.edu>
Source record: 44262

Hi all,

I recently got my General ticket, and now I'm looking around for a used HF rig.

I'm a married student, so I don't have a lot of money, and unless I get
really lucky my budget sits at around $200, maybe a tad more. My question:
what is a good intro rig for a small budget?

Here are my requirements:

* The rig should be suitable for mobile use (accept ~13V power input).
* At least 80-10m (40-10m acceptable in a pinch).
* SSB/CW (I don't need AM or FSK, although those are nice).
* At least 100W peak transmitting power, but transmitting power should be
adjustable to a reasonably low level. This is a must, as I'm moving into
some apartments where Hams "causing" interference has been a problem in
the past.

I would *like*:

* All solid state.
* Antenna Tuner.
* SSB/CW filters.
* I'd prefer a rig made by one of the "Big Three", but any HF rig with a
solid reputation is okay. I'm leaning toward Kenwood....

Does anyone have an opinion on what a good intro rig would be? Is what I
need even possible on my budget?

Thanks!

-Josh Senecal, KG6IBF

I got to ask, because I am still real new to all of this. How do you
locate the " electrical-supply ground "?? Where I would be putting
up my " shack " would be about 20 feet from the service panel.
However when the guy installed the satallite dish he grounded it to a
cold water pipe off the side of the house. This is on the other side
of the wall from where I would have the TX. Is this good enough??

Thanks.

Dan

Water pipes are not always a good idea for a ground.

Take my QTH, for example. All the water pipes are copper but the line
coming in from the main water line is plastic. Not good for
grounding.

It's better to have something that you know is grounded.

5364. FS: 10 thru 40 meter vertical antenna!

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-25 13:51:38 UTC
From: moody1951@aol.com
Message-ID: <20020425095138.28399.00003712@mb-fu.aol.com>
Source record: 44269

I have for sale one of the finest amateur trap verticals manufactured by anyone, anywhere (Taylor Radio). It's the HQ-1040-AV, a omnidirectional, self-supporting trap vertical that operates on all bands 10 thru 40 meters. It is designed specifically for ground mounting for those who have limited real estate or, just don't care to install long wires. The SWR of this antenna is such that you can operate 10 thru 40 meters with an SWR of 2 to 1 or less. The use of high Q traps provides buil- in band selection. Mechanical height is almost 20 feet, 52 ohms impedance, can take up to 2000 watts. Antenna is in very good condition mechanically, electrically and cosmetically. Has booklet. Pick up only in Mobile, AL. I'm selling because I'm out of work and need to raise some grocery money.

I'd like $100.

Thanks,

Reggie

You need to save more money. You'll need a power supply, and it will run $100 to $125 for a generic brand -- Samlex, MFJ, etc.

Your rig, used, with your requirements, can be had for probably $300 to $400. That will get you 100 watts, ssb/cw, solid state, 160/80 thru 10 meters, with the variable power output. You might pass up the built-in "antenna tuner" as these aren't really antenna tuners, they're more like adjustors so a resonant antenna can cover a little more space on a band. Likely rigs might be an Icom 735, Kenwood 440 or 430, Yaesu 757. A decent external antenna tuner can be had for maybe $125-150 new, less used.

Also, keep in mind you can buy a brand new transceiver with everything you want for about $600 plus power supply -- an Icom 718 or Yaesu 840.

Good luck...

I have a aea iso loop 10-30mhz with control box control cable and antenna. There is a crack in the plastic on the loop but it works like new. This happens to all of them. Its been up and down at my shack and used for camping. The thing performs well. I would like 150.00 or a UHF mobile rig . tnx w9jcm

5374. How does a noise canceller work?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-25 16:32:56 UTC
From: jason_hsu@my-deja.com
Message-ID: <f7d9a152.0204250832.b5144c5@posting.google.com>
Source record: 44279
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

There are several noise canceller products on the market, such as the MFJ-1025 and MFJ-1026.

http://www.mfjenterprises.com/products.php?prodid=MFJ-1025

http://www.mfjenterprises.com/products.php?prodid=MFJ-1026

Both of these products are said to have the ability to remove local AND DX noise sources. This would be a miracle on the lower bands on summer nights, when distant lightning strikes wreak havoc on the bands.

From what I understand, it connects to a signal antenna (your regular transmit antenna) and a noise antenna (a second antenna). The signal antenna picks up the weak signal and the noise. The noise antenna just picks up the noise. You amplify the noise from the noise antenna so that it is the same intensity as the noise from the signal antenna. You adjust the phase of the noise from the noise antenna so that it is 180 degrees out of phase with the noise from the signal antenna. The received RF from the signal and the noise antennas is added, the out-of-phase-noise components cancel out, and only the RF signal reaches the receiver.

The BIG question: Why doesn't the noise antenna receive some of the signal as well as the noise? Even if the noise antenna is much less efficient than the regular signal antenna, wouldn't this diminish the noise received as well as the signal received?

My understanding is that there is a difference in phase between the
desired signal and that of the noise given their different source
locations. That gadget can be tuned for either one. MFJ explains it
pretty well....

5377. Need Icom AT-500 bandswitch

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-25 18:25:02 UTC
From: FJose <eb5agv@ctv.es>
Message-ID: <3CC849FE.7AEE855C@ctv.es>
Source record: 44283

Hello!

I have just received a nice Icom AT-500 antenna coupler. I knew it had a fault in the bandswitch and I have looked at it. Bandswitch is made of four wafer switches. One is phenolic made, as it just switches control signals. Other three are ceramic switches, as they switch RF power signals. In my unit, center ceramic switch has arced over and it has several contacts completely destroyed. I wonder if somebody has an spare or just a damaged unit, as I can repair it with parts from any of the three ceramic switches.

Thanks for your help!

Regards,

JOSE

>with the PS for $100.

Yeah..my very first HF rig was a Henry Tempo One which was actually a Yaesu product made for Henry. It worked fine, taught me how to tune plate and load, and I made many contacts easily both domestic and DX with a simple dipole.

The only minor annoyance I had with that rig was that it ran hotter than a firecracker. In fact by the time I became the owner someone else had already added a muffin fan to the outside of the TX cage, Even with the extra fan it was a real hot mama!

But it sure did get me on the air and even got some "great audio" reports. Basically because most folks don't know what "great audio" really is....and it's - NOT - what you hear on 14.178 either....that's wet pants sissy audio!

5383. 6 Meter Question?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-25 22:59:32 UTC
From: b_fultz@yahoo.com
Message-ID: <72e005b9.0204251459.67f4b331@posting.google.com>
Source record: 44288

I have been a Ham for nearly 40 years, so you would think I would have the answer to this, but I am stumped. I recently bought a new HF rig, which also covers 6 meters. Not having an antenna up for 6,I switched in my dummy load to check the output power. The radio put out nearly the rated 100 watts in the repeater portion of the band, but as I went down to the bottom of the sideband portion I noticed a small power drop and the SWR went from nearly flat to 2:1. This should not have happened on the dummy load. I then noticed that I was not switched to the dummy but had inadvertently switched over to my Tri-band 20-15-10 meter beam. Not only did the antenna present a great match over most of the band, it also exhibited excellent front to back rejection and forward gain. I was able to null out a local repeater from a 30 over S-9 to an S-3 signal. My question is what combination of frequency mixing is going on here to make this work so well?? I am certainly not complaining, and I am very happy it works,but why does it work??? Has anyone else out there experienced the same results, or is this a well-known fact in the 6 meter community, and I am only now finding out about it for myself??

Please see my Astatic DN500 Microphone currently up for auction on e-Bay.
This mic is in very nice shape. It is a high impedance, dynamic microphone
from the 1950's. It is a good microphone for boatanchors.
It is wired for Collins radios and works great with my S-Line. It has the
original paint which is the same color as the front panel
of the S-Line and KWM-2s. The color in the pictures looks more blue. This is
due to the lighting when I took the pictures.
Thanks, Charlie Hugg, K5MBX

A Kenwood TS520 with the DC power supply can be had for $200,
especially if you find it locally. It meets all your "requirements"
and it also runs on AC power, so there is no need to buy a seperate
power supply. It is not all solid state (3 tubes in the driver and
final amp). It does not have an antenna tuner but its manual output
tuning circuit will match to anything the no-tune radio's antenna
tuner will (and more). It will come with an SSB filter. A CW filter
was optional when the rig was new.

These are solid rigs with a good reputation. Not many people who have ever owned one will say anything bad about them.

It sounds like your new radio has a software feature to switch the antenna port when operating below the FM portion of 6 meters. One reason for this would be that while FM operations are made with vertical polarized antennas, CW and SSB operations are usually with horizontal polarization. Check your operators manual to see if this is a feature of your radio. Your tri-band antenna probably works ok at a harmonic of 10M.

I don't think this has anything to do with software fetaures switching antenna ports on the rig. You didn't say what sort of tri-band beam you have, but it sounds like it happens to be resonant in the 6m band as well. Or the rig may have a built-in tuner which is capable of matching to your tri-bander on 6m. Either way, you've just saved yourself the cost of a 6m antenna.

Lots of good advice has been given. My favorites "close" to your price range and reqirements would be the Icom IC-730, the Kenwoods, TS-180s and Ts-130s(skip the TS-120s), the Yaesu FT-727(is that the right number? The one Heathkit sold, also), and the Wayfare(don't remember the model number). The Kenwood TS-520 is also a good choice, but as noted earlier, not solid state.

In addition to a local club, an experienced ham could help you make a selection at a local hamfesr/swapmeet. If he knows the seller he could probably get you a money-back guarantee from the seller.

Center pin is positive.

"Battery pack" voltage required is 6.3-15 volts DC
"DC in" voltage required is 7.2-16 volts

Max power out is 5 watts.

I won't begin to assume that I know enough about the subject to tell you anything that you don't already know, Bill. But I will say congratulations for having the curiosity to discover one of the pluses of having a six meter capable HF rig.

I am currently using a Van Gordon "All Bander" dipole that is fed with 450 ohm twinlead. I started out using it on HF, but quickly discovered that it works very well on six meters too. I do have to use a tuner, but I was using a tuner on HF anyway, so no big inconvenience has occurred. I am astounded at the excellent signal reports I receive, both locally and from distant stations. Who'd a thunk it?

5395. Mobile Dual Band Opinion

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-26 03:33:15 UTC
From: TF <TF@nomail.com>
Message-ID: <%T3y8.68218$%U4.14096872@twister.midsouth.rr.com>
Source record: 44201

I would appreciate any opinions on my decision:

I have been out of Ham radio for almost 10 years and now want to get back in. I am looking at getting a mobile radio. I am also in Public Service, so I want to be able to listen to about 6 public safety frequencies. I am looking for something that will allow me to scan those, with a priority on our main dispatch frequency.

I would like to spend around $300.

I narrowed it down to the following:
Alinco DR-605TQ
Kenwood TM-G707A
Yaesu FT-7100M

Alinco - Seems like a great radio but - No Alpha display, Only High (50W) or Low (5W) - Blast em or low pwr

Yaesu - This unit does almost everything I want, but the bad reports on quality have me scared. I talk to yaesu and was told they have been corrected but there is no way to tell which units have been modified. They have a backlog of over 6 weeks to fix them.

Kenwood - seems like a good solid unit. Does not have dual rcv or cross band, but I can live with that.

At this point I would really like to go with the Yaesu, but the quality problems worry me. It looks like I am going to go with the Kenwood.

Thoughts??

5396. Motorola SP10 wated!

On behalf of my employer, I am interested in picking up either extra HT600 (the old grey bricks) or HT750's (smaller black colored ones) handheld transcievers.

These would be for use with the following frequencies:

Channel 1-simplex 469.825
Channel 2-Repeater, 469.825 TX and 464.825RX

These would need to be in good shape (on a scale of 1-10 with 10 being perfect) and need to be about at least an "8" condition. Also interested possibly in charging units and extra batteries, especially for the HT600's.

Please email to kc8pmxNOSPAM@diamondcs.net (REMOVE NOSPAM TO REPLY) if you have any of these particular radio's.

Thanks,
Ryan KC8PMX

5399. Good TNC For Mobile APRS?

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-26 06:43:46 UTC
From: Douglas Gavilanes <gavilan1@earthlink.net>
Message-ID: <3CC8F795.6307FA6E@earthlink.net>
Source record: 44203
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I am currently struggling with a Pac-Comm Tiny-2 TNC that seemed to work fine for about 3 months, save for occasional random eEprom resets back to default settings. Now it seems that the TNC sits for days sending my location as WAITING FOR GPS DATA. I believe that everything is set properly, but it still doesn't ever accept data from the GPS. The baud rate is correct, the GPS and serial cable are tested fine, the TNC RS232 port works fine with the PC at the same baud rate as the GPS, but I haven't been sending good position data for over a month. Pac-Comm tells me that spikes in my auto electrical can reset the TNC, but this TNC randomly resets even with the vehicle off and parked. Any little bump can also cause the TNC to reset, so obviously there's a shock issue, but even when it's standing still, and I've reprogrammed the TNC for active APRS, the unit refuses to update the LTEXT sentence, and resets after 10 to 20 minutes. Has anyone seen this before? Some folks around here have mentioned in passing that the Pac-Comms are known for random resets, but what TNC do most folks use out there for APRS, and are there any power supply issues similar to what I'm seeing? I've used Tiny-2 TNCs for years for regular packet, and never had a single problem (on AC power, of course). Using them in a mobile app. is another story. What baffles me is that I did get at least three relatively good months from the TNC before this unidentified problem.

TIA,

Doug, N6XQY

Hi,
Looking for schematic of this programmable attenuator, I have damaged the
solenoid circuit for cell1. Weinschel wont provide a schematic - they want
return of atten for repair. I think its just the TVS thats damaged but would
like to be able to confirm.

Any help appreciated

It may do so - so what? If the desired signal is that strong, then
reducing it a bit is not going to hurt.

Or you can adjust the noise antenna gain until the desired signal is
not reduced. The result would be a compromise on noise reduction.

The whole system works when there is a different S/N ratio between
the two antennas. If they are the same - as is often the case with
DX noise, then there is little or no noise reduction possible by
such simple signal inversion.

gundoc@iglou.com Some of these lists are not swap lists and only tolerate my post because it is only once a week. To the group owners thank you for letting me continue to post to the group. I have had requests to put spaces between the radios on the list so I am going to try this on this list. Let me
know what you think.
Dean

GE Portables

GE MPA VHF 146-162 full system keypad. Radio is as new and is almost perfect. The only flaw is the grip tape under the PTT button is peeling at the edges. Otherwise perfect. The next feature is, The radio is Key pad programmable. 16 channel scan and front face programmable. Has a like new battery and a good rapid charger. Also a belt clip. $500.00

GE MPA VHF Select 157 - 174 split. Nice radio 9 condition with battery and standard charger. I have it programmed down to 154 MHz with no trouble but will go no lower. $200.00

GE MPA UHF Scan 440 - 470 192 channel scan. Radio works great. A little paint wear on the edges but I have seen worse. With charger and battery. $225.00

GE MPD UHF select model 440-460. 48 channel alpha-Numeric display. programmed on the 440 ham band and works on the local repeaters and GMRS. With Battery and standard charger. Nice 8 - 8.5 radio. $100.00 Also have 1 in about a 7 condition $90.00

GE MPD select model 470.- 488 MHz. 48 channel Alpha-Numeric display. With battery and standard charger. 7-7.5 $90.00

GE MPD Scan UHF 440- 460. 48 channel Alpha-Numeric display. Also programmed on the hamband for testing. Works on the local repeaters and GMRS. with battery and standard charger. $125.00

GE MPD scan VHF 150.8 174. 48 channel Alpha-Numeric display. These look good and come with a battery and standard charger. 135.00 each.

MPD Voice Guard VHF system model with full keypad. 48 channel alpha display. with battery and standard charger. $140.00

GE PCS UHF 8 channel. I have this radio on the uhf ham band for testing and it works the local repeaters. with battery and charger. $95.00

GE MPS VHF Like new 10 channel. With new battery, new antenna, and a standard charger. $65.00

GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00

GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $225.00 all 3 radios.

GE Monogram VHF 10 channel portable. 157-179 split. ex CSX radio. I sold this radio a year ago but have taken it on trade. Condition 8 with belt clip and charger. I had this radio run for stolen from CSX by a local CSX Special Agent when I first bought these in a lot and was told that it had been sold at salvage. Perfect for a RR Museum or shortline on a budget. This could also be programmed for marine frequencies. Like new tall
Battery. $100.00

GE Mobiles

GE Phoenix SX VHF 128 channel scan. No accessories. Has all 8 proms. $100.00

GE MLS UHF 8 channel. With Mic, power cord and hang up box. MLSU240
450. - 470 Looks good. $125.00

GE MVS UHF 16 channel scan. With Mic, Bracket, and power cord. $125.00

GE Mastr exec II VHF 75 watt mobile complete with accessories. $60.00 each

GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each

GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00

.GE Ranger VHF 150.-162 100 watt mobile. Complete with cable, Mic, speaker, and S550 control head. This is a great public safety mobile or can be tuned to the 2 meter ham band. $175.00

GE S990 head. Looks new but I have not had time to test this yet. $75.00

GE S550 head 16 channel looks good but not tested. $35.00

GE Mobile Vehicle Adapter For MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com) With mic, speaker, and power cable. $100.00

GE Accessories

GE TQ 2310 suitcase programmer. Has PLS, Phoenix, Delta s/sx, Voice Guard, MPS,
and Ranger. Printer is not working but I tried and it programs radios without the printer.
Has manual for the programmer and the computer. Has Phoenix cable and Voice guard cable. All in the original GE case tested and working. (except printer) $850.00

Mastr II control cable. $8.00 each

Mastr II head for mobile repeater operation. $5.00

Mastr II Mic. $5.00

Mastr II 8 channel tone boards. $5.00

Mobile Repeater cable for Mastr II. $10.00

Mobile Repeater cable for Delta or Ranger. $30.00. I have seen programming cables made from these.

GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2. If you buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.

GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each.

GE Delta cables. These are the downloading type used with the S820 heads. $40.00 each

Delta mounting plates. $10.00 each

Ranger mounting plate. $15.00

GE S-550 / 500 and others mounting brackets. $5.00 each

GE MPA, MPD, MTL public safety mic. $35.00 each

GE MPA, MPD, MTL standard Speaker mic. $25.00

GE PCS Universal Rapid charger. $35.00 each SOLD OUT

GE MPA standard chargers. $20.00 each

GE MPA Rapid chargers. $30.00 each

GE MPI desk charger with wall transformer. $10.00

GE MPI Rack charger, 8 position. 25.00

GE MPI Mobile battery charger, Rare. $20.00

GE Battery discharger analyzer. For MPA, MPD batteries. Attaches to a rapid rack charger with a DB 15 cable and uses a MPD body to attach a battery to. Has LED readout in display area of MPD body to tell discharge rate. Another rare GE goodie. $45.00

GE shoulder strap like new, attaches where belt clip is. $15.00

GE Belt clips. $10.00 each

GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card and power supply / speaker. $300.00

Other Radios and Accessories

Motorola Saber III VHF 146-174 split. 120 channel Alpha-Numeric display with secure - net module. (no out of country sales) des I think. I have been using this all week and talking on the ham band to test this radio. Battery

has lasted all week during drive time so it seems good. With rapid charger and big battery. $500.00 or trade for a VHF MRK II

Icom 3200 a Dual band ham radio. Has box and manual but no mounting bracket. Has tone squelch board installed. $205.00

Icom IC 24-at Dual band Portable. In good shape, Display has no scratches and only 1 small patch of the paint is peeled off of the back of this radio. With manual and wall charger. $170.00

Maxon 5050a Low band portable pair. Like new condition with 1 battery charger but I will split up the pair if someone wants 1 radio only. 6 channels
programmed
for 10 meter ham band on 2 repeater pair and 4 simplex frequencies.
2 radios and 1 charger $195.00

Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland. $75.00

Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00

Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00

Motorola Mitrek VHF high 110 watt drawer only. $50.00

Motorola Adapter for MX radios for the 1801 suitcase programmer. A and B prom. $175.00

Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all

Uniden SMS 825 ts, 800 MHz Dash mount radio. $75.00

Voter from IMTS phone system. 2 rec and 2 tx cards. $40.00

Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00

Consignment section

This area is for a few friends who like those other radios you know

"Motorola" They are good people and I will pass along any trades you may wish to make.

Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete. $425.00

Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each

Motorola HT1000 UHF Intrinsically safe, Re-cased looks new. 16 channel scan with
charger. $425.00

Motorola P200 UHF high power. 6 channel. $150.00

EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, anything you have extra. MPA or MPD portables what do you have and what do you want for them?
Johnson scorpion program cable. PSX200 UHF mobiles.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. If I think it may be bad I will not list it. I take cash, Postal Money Orders, Paypal, and checks but I hold them for up to two weeks to clear before I ship. If you have a question E-mail me.

Hi Group,

I understand that it is possible that us ham will get a new 60 meter band.
I have a FT-757 radio that has the tx unlocked and can transmit between 500KHz
and 30 MHz.

This rig was manufactured aleast 15 years ago.

OK, the question would be if it is legal (once the band is opened) to transmit
on 60 meters with this rig?

Paul

If you have a battery charger and a lead-acid battery, you can
postpone the power supply. The battery will smooth out even a
somewhat noisy charger.

Or you can pick up the latest QST, which has plans for adapting a PC
power supply (30 amps!!) -- for a total outlay of $10, including the
PC power supply.

As an licensed amateur radio operator, you are responsible for the emissions emanating from your station. The FCC does not care about certification/type acceptance of your equipment. That sort of nonsense is for CB, marine and business radio users. Besides, how else could you legally use a kit or homebrewed rig on the ham bands?

Ed Cregger, NM2K

Hi, everyone.

I am looking for some feedback from those of you who are using a UPS in your shacks. I installed a fairly decent (i.e. not your average Radio Shack UPS) unit the other day and the noise from its chopper is horrible. Btw, my antenna is very close to the shack and when it's unplugged, there is no hash/birdies of any kind on the TS-850.
The unit in question is PW9125-2000 by Powerware - a commercial type UPS with excellent specs on filtering almost any kind of garbage on the 120 V line. Any feedback would be appreciated.

Sounds trying. :) I use APC ups's. Have two in shank area, within 10 feet and a third about 25 feet away. Have even run Astron power supply and rigs off one and never noticed any noise.

Regards,
Jim

I take it that this is an online type that is always on? A better
option might be a backup supply that only cuts in when the commercial
power fails. At least it won't be making noise all the time.
If you are concerned about cleaning up the incoming power, a Sola (or
other vendor) constant-voltage ferro-resonant xfmr would be best, but be
wary of connecting together with a UPS.

Only if you have a valid ham license for this band.

U.S. amateurs can use any piece of equipment that meets the minimal
requirements of the FCC regulations, even stuff 70 years old.

I have three APC units in my shack, absolutely no problems from HF up to 1.2 gig. All of my station power is supplied from a UPS, even the Astron power supplies run from one.

FWIW, in my profession I service corporate computer networks, and the APC brand is the defacto standard in all enterprise networks (and so far I have never had to replace one...)

From my understanding of how this is donee, the comments about phase
cancellation are correct. However, you should normally locate your noise
antenna(s) as close to the noise sources as possible. In this way, because
of the proximity to the noise source they are picking up much more of the
noise and less of the wanted signal (If they are placed within a building
for example)

I use the Yaesu FT-3000. It will do what you want, and provide 70 watts in the VHF area! The 3000 has been out for 5-6 years, so its pretty solid. If you care about transmitting on UHF, you might lean more to the 7100. The 3000 is recieve only in the UHF region, but does go all the way to 1000 Mhz!

I was looking at some of the new Kenwood radios.

I understand how coded squelch works, but don't understand how Kenwood implements it. Can someone please explain to me?

They have a [T]one mode and a [CT]CSS mode. You can only have one mode on at a time.

I need a mode that both transmits (encodes) the tone and will not allow reception (decodes) without the tone for a single channel. Is this [CT] mode? Is [T] mode only transmitting the tone, but has open receive?

I'm going to have to disagree with the part that the FCC "does not care about certification/type acceptance of your equipment". The FCC does care about which equipment you use. Just the other day, I got my hands on a Bendix/King PRC-127 military hand held radio with a transmit range of 136-174 MHZ. Which was capable of repeater use on the 2 meter ham band. I too thought that if you home brewed equipment that it didnt matter to the FCC. Well, as i was chatting on the local repeater with this HT, i was asked as to what kind of rig i had, and i told them., after i had said what kind of rig it was, a more "experienced" ham jumped in and said that my radio was illegal, because military radios are not type accepted and are thusly illegal for commercial use. So, i stopped using it and called the FCC office to confirm... yes. it was illegal for me to use this radio because it was not accepted by the FCC. Thankfully that other ham out their was nice enough to tell me politely what i was doing wrong. At the same time, i got really mad because the radios that are mounted in our HUMVEE's are capable of transmitting on the 6 meter band. So anyway, not all radios are legal. Just wanted to point that out so nobody gets into any kind of trouble. Oh, btw. $25,000 fine, and up to ten years in jail for using illegal equipment.

You won't find anything solid state for $200. Best you'll probably do at that price is a tube Drake or hybrid tube Yaesu. Not really all that bad if you're on a strict budget.

You'll need to spend at least $400 for an older fully solid state rig. You'll need to spend at least $600 - $700 for something that's not too old. These are hamfest prices. An amateur radio store will charge you quite a bit more.

Don't forget a power supply and microphone. That's going to run you another $100 - $200.

Once I did find a nice Kenwood TS-140 in the box for $200 at a country flea market. That's the best deal I've seen on a solid state HF rig in 20 years.

This is the first time I've heard of Powerware. It may or may not be properly filtered.

I use an American Power Conversion Back-UPS 600. I think I paid about $375 for it in 1996. It has never offered a hint of interference in any situation.

My main sources of RFI are a NEC MultiSync XE17 computer monitor and a Toshiba TV set. If I turn those two items off I get noise-free reception.

No problem with RF shielding. Phelps Dodge used UHF fittings on their
6 can VHF duplexers for years, and they (Celewave) still continue to do
so. Two UHF
females on each can. That's a total of 16 UHF fittings per duplexer set,
and the product delivers 100 dB isolation. Not my first choice in
connectors, but
it really depends on the skill of the installer for most VHF applications
rather than
design limitations.

Microwave racks and trucked radios operate well above the frequency range
the gentleman who started the thread asked about.

I agree with Walt.

I used to be involved with noise (RFI) location and mitigation at radio receive sites. I found that noise from a UPS varies by manufacturer and model. Some are quiet, some can be quieted, and some would probably cost more to quiet than to replace.

Example: One problem some manufacturers overlook is that the battery leads need to be filtered if the batteries are outside the metal enclosure. On multi kilowatt units, this gets a little onerous.

Recommendation: Try before you buy. Most manufacturers have no idea about RFI from their products, although few will admit it. I encountered a site where HF was absolutely shut down by installation of an inappropriate huge UPS. It resulted in the site eventually being shuttered and abandoned. A DF site had a UPS go bad and was replaced by an available unit. They could actually DF on their own equipment building on wideband noise from 4 to 9 MHz. Returning to the DF system manufacturer's original UPS cleared it all up.

In general, the less than 1 kW APC and Best units are relatively low noise. Almost none above 1 kW are quiet as built, unless things have changed in the last 2 or 3 years.

Your posting, (below), seems to have overlooked one critical fact;
though your radio is not type accepted for "commercial use" as you quoted
both that other ham and the FCC, it is legal on the ham bands, if you are a
licensed ham. Lots of hams still use some war surplus equipment for their
amateur transmissions. Amateur radio is NOT commercial radio.

Until 15 months ago I worked as a firmware engineer at a company that made UPSs (not APC, although APC makes fine products). All UPSs must pass FCC emissions standards. Those standards are tight enough that it should not produce any noticable noise in even the best radio. I would suggest taking the UPS back to where you bought it. Technically it is not legal to sell in the US. Although to be fair, it is hard to control all these parameters on a mass production basis. Some manufacturers are better than others at it.

Okay, but how is working a 2 meter repeater "commercial use." That is amateur
use.

I first became a ham in the 50s when huge amounts of WWII military surplus
radios were available, and going for pennies. Many hams bought the military
units, and utilized them unchanged or slightly modified, on the ham bands.
Never, never did I hear they were illegal. Unless something has changed, I can't
imagine the Bendix-King military hand-held being illegal, so long as you put it
to AMATEUR USE, and you are legally licensed, as you indicate in your sig.

Now, if you try to put it on a business band, or citizen's or family bands, that
would be something else.

Yes, this latter paragraph describes how my Kenwood TM-V7A works.

The tone is subaudible, with a small FM deviation and single tone
frequencies below about 250 hz.

You got some bad info both from the gent on 2 Meters and the drone who answered the phone at the FCC. Amateur radio operators have been using military gear since the earliest days of the hobby. In fact, after WWII, the government made vast quantities of this gear available surplus. Surplus gear has always been the big carrot for MARS operators. My KWM-2 and 30-S1 amp were MARS freebies. My first rig was an old ARC-5 aircraft radio with a few mods. Gonset "Gooney Birds" were a dime a dozen for 6 and 2 meters. The entire Collins S Line were military radios, also used by hams.

Type approval allows the manufacturer to market and sell the radio for an intended purpose. Bendix/King could never sell that radio as a ham radio rig but hams are perfectly legal to use it for amateur use as long as they are responsible for the rigs compliance. I have seen some folks using military FM rigs with frequency deviation way beyond acceptable. Not good. I have used the radios in my HUMVEE and jeep for 6 meter simplex. I have also used a Fairchild GLQ-3 to talk to the states from Korea twice a week (had to do ops readiness testing on it anyways so why not a log periodic instead of a dummy load :-))

I am pretty certain that as long as what goes up the feedline is legal, the fcc does not care where it comes from. I would love to hear from anyone who could cite a regulation stating otherwise.

Steve

Aw, common, Alan. Tubes are still fairly easy and cheap to acquire. A pair of 6146s can be had for $30. and the 12AT7 to drive them is around $8. if you shop around there are even cheaper prices. Replacing them sure is a lot cheaper then trying to repair a solid state rig! And, if you take good care tuning your rig, they'll last many many years.

Do a search on the web for tubes. My search turned up tons of sites selling tubes, such as:

http://www.tubes4u.com/2Planar.htm

and

http://www.audiotubes.com/12at7.htm

A friend has an FT-767 that seems to have a bad encoder- sometimes turning the dial works and sometimes it doesn't. Other means of frequency control are fine.

Has anyone here replaced the encoder? I'm wondering if I'll be able to tilt the front panel down to get to the encoder, or if I'll have to unplug a million wires and remove the panel altogether?

Source record: 44151

Folks,

I am trying to decide between a TS-2000 and TS-870S.
The 2000 has the 6m,2m, and more bands, but the 870
has the higher price tag? It appears there is more in
the 2000 so why is it so much less expensive than the
870? What feature set in the 870 demands the higher
price tag? I thought both rigs had similar DSP functionality
The 2000 appears to have many more bells/whistles...

Am I going to be sacrificing receiver performance
for bells/whistles if I go 2000...

Just trying to figure out the price difference...

Thanks for your comments...
Ku3o

I apologize for the incorrect word use of "commercial" I was told that the specific radio I was using "PRC-127" was not legal for amatuer use. I was told by a fellow Extra class ham, and by the FCC. Matter of fact, when I was on the phone with the FCC, they seemed pretty upset that I had used it on amatuer bands. But hey, I totally agree with everyone elses remarks pertaining to non-type accepted radio. I just felt that it was info that was correct being said from the FCC. And that I didn't want anybody to get into trouble. But, yes, if anybody could show me in the rules that it would be legal, and give me the paragraph numbers etc, that would help me out alot. Anyway, sorry for the disturbance in here. I meant no harm.

Which increases speed fastest, sending CW or decoding CW?

For the FCC test, it is assumed that it you can decode CW you can send it. This suggests decoding is the harder task, but doesn't answer which is the quicker way to get faster.

Alternatively stated, does the side-tone listening you do when you send help with decoding? Or is it little help because the part of the brain that recognizes sound patterns is bypassed when you already know the character?

It's just within the last couple of weeks on this or another newsgroup
that I have read other people's complaints about the outrageous cost of
the sweep tubes that were commonly used in the final amp stage of many
common tube or hybrid transceivers. 6146 tubes may still be cheap, but
they aren't what most 70s-era hybrid rigs were using.

I agree that solid-state stuff wouldn't be cheap to repair, but with
solid-state design came built-in protection circuitry for the finals
that tube rigs typically did not have. And since we are talking about
used rigs, there is no guarantee that they have been looked after well.

With all due respect Rob,

There is a space agency that I know of where crimp on connectors are
mandatory when using BNC. They have been stressed to 2000 pounds pull
before failure.

I have seen the type of failures where you can simply pull a connector
off. But this is usually due to either wrong components being used for
the type of cable, and/or wrong tooling crimping the connector on.

My opinion is that hobbyist will do better with soldering a connector on
because of the myriad of cable types he/she is trying attach a BNC
connector to. I know I would have to keep quite a collection of
connectors and tools to meet even my occasional needs.

Best Regards

Christopher Cox

As I recall, 6146 tubes are what most of the 70s-era rigs from the major mfgs were using. Some of the low-end stuff used sweep tubes. If he sticks to hybrid Icom, Kenwood, or Yaesu in his price range it'll likely have 6146s. At any rate, that would be one of the things I'd check out before buying. If it had sweep tubes I'd keep looking.

Source record: 44163

Hi, Ken...

Sorry to say, sending doesn't help much. I have found two things that might be helpful...

1) Listening and watching as a computer CW program decodes CW definitely helped me. I tried this when I had let my speed get down around 15 and before I knew it, I was looking away from the screen yet still copying at 25-30 wpm.

2) I have to drive to and from an airport twice a month. Depending on which one, it's a 135 or 185-mile drive each way. I got in the habit of listening to CW during the drive and within a couple of months I was receiving 30+ again. The only problem here is, my sending speed (for good code) remained something below 20 wpm.

There is no substitute for copying live code. To keep your send and receive speeds "balanced," you need to practice both.,

Good luck... Ed, W5EJ

Mike,

You are OK, as noted by the other fellows.

You have run smack dab into an interesting
aspect of human nature, particularly the beaurcratic
type of folks.

They never say "yes" because a yes answer would
some how imply that they gave permission and are
responsible for anything bad that happens. It is much
easier to say "NO" and be done with it.

This happens a lot. Bottom line, as pointed out
before, is that any military surplus, commercial,
home brew, etc rig is OK on the Amateur bands
so long as it meets the specifications put on us
by Part 97 of the regulations, which by-the-way,
are much more lenient than the commercial
specifications!

CU on the bands

>
>Tom

The standards are **NOT** especially stringent. Emissions at maximum allowable Part 15 levels can and **WILL** cause harmful interference to nearby amateur HF communications.

The allowable emissions for "home" type products (Class B) is 250uV at 50 ohms = -59dBm, per conductor. Total power of the common-mode emissions (two lines, hot & Neut) is twice the power, -56dBm.

My receiver noise floor is -138dBm. Weak DX and QRP signals are not readable with the 20dB attenuator switched in, so the harmful interference threshold is no more than -118dBm. (This is for the 10M and 15M bands. Higher background noise makes the figure on 160M perhaps -95dBm, depending on how quiet your QTH is).

With less than 62dB path loss the noise will regularly obstruct the desired weak-signal communications ("harmful interference" per Part 15). If the UPS is close to your antenna, you don't have that much path loss!

But the unit in question is a commercial product, probably Class A. These have HF emissions limits of 3000uV = -37dBm per conductor, -34dBm total common mode power. Now the required path loss is 84dB! Interference **WILL** occur at this power level unless the UPS is far, far away from the receiver antenna. Which is why any product marketed for possible home use, regardless of whether it also has business uses, must be Class B (in the USA).

So, make sure you your unit has a Class B label (this is case where Grade "A" products are inferior!). Then keep it as far away from the antenna as possible. Then add outboard ferrite chokes and RFI

filtering as needed.

Both help, as both help drill the characters into your head. But for
the most part I think only practicing faster decoding will help
increase speed. And you have to push yourself a bit to do each slight
increase in speed. IE: If I did 40 wpm, but wanted to do 50 wpm, I'd
hunt up people that are working 50 wpm.
You have to actually work that speed for a while to have it sink in.
Wanting to increase 10 wpm just by sending faster is not going to help
you much. You are not "pushing yourself" when you do that. You also
have to train the ear to decode the faster characters. Only receiving
will do much for that. MK

5471. Variable attenuators?

New, never used, still in the Toshiba box. I bought 12 of these for an amplifier project that never happened. Got the transistors, power supply and heatsink. That is as far as I got. These are the same devices used in the Icom 2k solid state amp. The MRF448 is a replacement for these I am told. RF parts has the MRF448 for $79 each. I would like to get $800 for all 12, or will trade for an Amateur HF tube amp. I have seen these things for as high as $165 each.

Mike, you have absolutely no reason to apologize for your questions. Unfortunately, the people to whom you spoke were absolutely and totally wrong. Working for the government does not make people infallible, although in the case of that FCC employee, I expect he didn't know himself and didn't want to bother researching it or admitting his ignorance.

I fully agree with what WG7X said. Be sure you understand, you are fully entitled to use most any transmitter in the amateur band, as long as you are licensed, and as long as you are putting out a legal signal.

As far as your request for a regulation permitting your operation, I think you need be looking for a regulation the forbids such operation, and you won't find that.

5485. FS: Books on Radio Antennas

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-28 13:08:57 UTC
From: oldbooks78@aol.com
Message-ID: <20020428090857.07218.00006418@mb-dd.aol.com>
Source record: 44190

I currently have the following books for sale on radio antennas. Postage is $2 for the first book and $1 for each additional item (within the US, at cost elsewhere). The books are:

Moxon, L.A. "HF Antennas for All Locations" published by the Radio Society of Great Britain, 1991. ISBN 0900612576 The 260 page softbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. A thorough treatment of HF antennas. Available for $9.

Straw, R. Dean (editor) "The ARRL Antenna Compendium (Vol. 6)", Newington, CT, U.S.A.: American Radio Relay League, Incorporated, 1999. ISBN: 0872597431 The 200 page softbound book is in fine condition, fresh and clean inside and out. All new articles (43 of them) on antennas, transmission lines and propagation - projects to build and new approaches to explore. Includes a CD inside the rear cover with the source data for modeling many of the antennas. Available for $12.

Straw, R. Dean (editor) "The ARRL Antenna Compendium (Vol. 5)", Newington, CT, U.S.A.: American Radio Relay League, Incorporated, 1996. ISBN: 0872595625 The 200 page softbound book is in near fine condition, fresh and clean inside and out except for a square neatly cut from the lower corner of the blank rear end page (it may have been a coupon or order form). Includes a diskette inside the rear cover with the source data for modeling many of the antennas. Available for $9.

Straw, R. Dean (editor) "The ARRL Antenna Compendium (Vol. 4)", Newington, CT, U.S.A.: American Radio Relay League, Incorporated, 1995. ISBN: 0872594912 The 204 page softbound book is in fine condition, fresh and clean inside and out.Includes a diskette inside the rear cover with the source data for modeling the antennas. Available for $10.

Hall, Gerald L. (editor) "The ARRL Antenna Compendium (Vol. 3)", Newington, CT, U.S.A.: American Radio Relay League, Incorporated, 1992. ISBN: 0872594017 The 236 page softbound book is in fine condition, fresh and clean inside and out. Lots of useful information on radio antennas. Available for $9.

Hall, Gerald L. (editor) "ARRL Antenna Compendium (Vol. 2)", Newington, CT, U.S.A.: American Radio Relay League, Incorporated, 1989. ISBN: 0872592545 The 208 page softbound book is in very good condition, fresh and clean inside and out. Available for $9.

Hall, Gerald; Paul Rinaldo; Maureen Thompson (editors) "ARRL Antenna Compendium, Volume 1", Newington, CT, U.S.A.: American Radio Relay League, Incorporated, 1985. ISBN: 0872590194 The 175 page softbound book is in fine condition, fresh and clean inside and out. Available for $9.

Erwin, David G4LQ1 "HF Antenna Collection", Radio Society of Great Britain, 1994. ISBN 1872309089 The 233 page softbound book is in fine condition, fresh and clean inside and out. Available for $9.

Orr, William I. "The W6SAI HF Antenna Handbook", Hicksville, NY, U.S.A.: C Q Communications, Incorporated, 1996. ISBN: 0943016150 The magazine-sized softbound book is in fine condition, fresh and clean inside and out. Available for $9.

If interested in any of the above, please email to "Oldbooks78@aol.com" to reserve. Thanks.

Dave

Personally, I would put that Bendex back on the air, and if that Extra Class ham complains to you again, send him to the http://www.fcc.gov site, and challenge him to find the regulation you are violating. He won't find one.

5487. Re: UPS and HF noise

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-28 13:47:04 UTC
From: Uncle Peter <radioconnectionNO@cox.netSPAM>
Message-ID: <s3Ty8.74855$3C4.1156599@news1.east.cox.net>
Source record: 44192
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Since you already bought the unit and own it... Have you tried clip-on ferrite
beads from RadioShack (and others) on the power leads entering and leaving the UPS? I suspect most of the radiation will be common-mode on the AC leads and that adding the ferrite chokes will have some effect in reducing the
interference.

The next step would be lining the inside of the cabinet with AL foil, and grounding
it to a good earth ground -- if available.

FOR SALE - Prices reduced:

Pictures available on request.

National NC-190 Receiver
This is nifty old receiver with that classic space age blue finish. Front panel looks very nice, but some of the knobs look crusty and need cleaning. Appears to be all original with no modifications. Receiver is non working but it is all there, and will clean up nicely. Will sell for $99.00 plus shipping

Harvey Wells Bandmaster Senior TBS-50C all band AM-CW transmitter In very good condition, complete and untested. Reported to be working when last used. No VFO or power supply. Front panel shows really nicely. Will sell for $109.00 plus shipping

Heath HD-15 Phone Patch. Unit is in excellent condition with all original knobs etc. Will sell for $16.00 plus shipping

Yaesu SP-901P Phone patch / Speaker Accessory
Perfect to round out your FT-901 line. Unit is in excellent shape but needs two scratches touched up on the top. Front looks great, including the original knobs, meter etc. Will sell for $40.00 plus shipping

WW2 British Mark 2 straight key. Missing two screws, but otherwise clean and in nice shape. Contacts are still in very good shape. A few imperfections, but will polish up and restore nicely. Will sell it for $39.00 plus shipping

Straight Key - for the CW buff who wants to be ready for straight key night. Also useful for beginners learning the code. This has locking bar for tuning and is an adjustable key with nickel silver finish. Will sell for $24.00 plus shipping

TS-175 Frequency Counter - exceptionally nice military unit in near mint condition with original chart. covers 125 kHz to 20 MHz. Will
sell for $75.00 plus shipping

LM-10 frequency counter - 'Type CRR-7402B crystal calibrated frequency indicating equipment' with original chart book, in very good condition. Will sell for $49.00 plus shipping

MFJ 204B Antenna noise bridge with original manual.
Will sell for $45.00 plus shipping

MFJ-941D Versatuner II antenna tuner in excellent shape. Matches about any antenna to your HF rig. 300 Watt antenna tuner that covers everything from 1.8 - 30 MHz and includes meter, antenna switch and a 4:1 balun. Meter shows SWR, forward and reflected power - antenna switch lets you select 2 coax lines, random wire/balanced line or dummy load (direct or through). Efficient 12 position airwound inductor gives lower losses and more power out. Has 4:1 balun, 1000 Volt capacitors, and a beautiful aluminum cabinet. Will sell for $59.00 plus shipping

Knight TR-106 with V-107 VFO
Excellent looking Knight 6m AM transceiver with the matching VFO. Also comes with the original, blue 'Knight' labelled Shure hand microphone. This radio can operate on either 12V DC or 115V AC. Comes with 115V AC cable. Otherwise complete and has very nice appearance. Sold as-is. Comes with a copy of the manual.
$125.0 plus shipping

5489. HAMFEST - BAYVILLE, NJ August 11, 2002

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-28 15:25:42 UTC
From: w2ce@aol.com

Source record: 44194

The Jersey Shore Amateur Radio Society is pleased to announce its 4th Annual Shorefest to be held August 11, 2002
at the Bayville (NJ) Fire House, Route 9, Bayville, NJ.

Table reservations are now being accepted. The hamfest is all indoors in 4,000 square feet of airconditioned pleasure.

If you plan to sell your gear in the the New Jersey shore area this is your only hamfest left in the area. Look at the current hamfest lists. Absecon, Brookdale, Shore Points, Garden State, they are all gone. The JSARS Shorefest is the only hamfest remaining along the shore from Sandy Hook to Cape May. With fog and early morning rain last year that's why we drew over 1,000 hams to our hamfest.

Come see all the area vendors in amateur radio and computers.

Visit http://www.jsars.org to see pictures of our past hamfests and to download a PDF hamfest flyer.

For advanced table reservations or tickets - Contact W2CE at (732) 657-9339 or w2ce@arrl.net

Source record: 44195

Hi Don,

It's a nice radio. I bought it yesterday at a hamfest so, I've not played very well with it yet.

It's very simple to use. I've read just some sections in the user manual and I've been able to do anything with it! The visual feature (spectrum view of the band) is very useful.

The receiver in HF is not very sensitive. Yesterday night I've heard only some strong station on 80 & 40M SSB and CW. I've to make some tests with an external antenna for 80 and 40M. Another thing very interesting is that you can change the mode (AM, SSB, FM, CW) on every band. I can receive some stations operating SSB on 2M.

Also, I have to make some tests with the VOX feature and the double RX, I think I can operate cross band repeat with this method!

Finally, I think it's a good product and I'm very glad of my purchase!!!

I've bought mine 579$CAN (including all canadian tax....0.638$US = 1$CAN) that is equal to 369.83$US. I've seen the same model for 359.95$ on HRO WebPage...Do you have sales tax applicable to your purchase in US ?

Let me know your comment when you'll receive your F6A!!

On my 706, I drilled a small hole in the front of the microphone
opposite the mic element. If you take your mic apart, you'll see that
the mic element is no where near the grill openings, it's way off to
one side. There is a narrow channel molded inside the front of the
mic to duct the sound to the element. The acoustic chamber behind the
grill has a rubber backing which probably mutes some of the higher
frequencies before they reach the mic element.

> tnx WB6GKI

The IC-2000 was a 10 watt transceiver and the IC-2000H was a 45 watt transceiver. The IC-2000 was never imported by Icom America. Icom, Inc stopped making different front panels for models like the IC-2000 / H sometime ago as a cost saving measure. So you will need to look at the serial number label to see which version it is

Buh - Loanie! (sp?)

Mike, someone is pulling your chain.

Amateur radio operators are responsible for their emissions.
The FCC could care less about which radio you use.

The next time you call the FCC office, make sure the janitor
or secretarial temp doesn't answer your questions. <G>

I have a Hamcom-type interface that converts the radio's speaker out into a signal for the PC's COM port. The PC is an 8086 DOS laptop without a sound card.

Is there a DOS program that will "read" the interface and decode PSK31? I also want to send, but I will cross that bridge later.

I have for sale a mint Yaesu FT-1000MP Mark V. I am the original owner and I am a non-smoker. This radio looks and works great. It comes with the following options installed: Both Yaesu 2.0 SSB Filters(2nd/3rd IF) and the 500HZ Collins CW Filter. It comes with the original boxes, FP-29 PS, Manual, hand mike, etc. I will deliver this radio to Dayton. I prefer not to ship it. If you have been looking for a Mark V, this is your chance to get one that looks and works great.

I am asking $2325, including delivery to the Dayton Hamvention next month. Check out my profile at eBay, userid: kc2mf. If interested, please send me an email at: k2wo@arrl.net

Thanks for reading this message!

Type Acceptance has to do with Commercial Radio Applications.. BTW the PRC
military ARE Type Accepted.

IFR-1200a this version just has a oscilliscope, generates pl tones,dpl. No dvm option everything working. will have a pic soon to post or email. All I have is the cord. Might be able to get a maintenance manual if I find it. Does not have tracking generator or spectrum analyzer. This is an 1200a not 1200s. It does duplex generate, deviation meter freq meter, 1k tone, sinad. Other than that it works excellent. and looks good not beat.

$2000.00 you ship cost about $40 ups ground.

I could imagine placing the noise antenna right in-between the PC and
the TV, while the main antenna would be between two trees outside of the
house.

I'm pretty sure the noise antenna will have a very different S/N ratio
than the main antenna ;)

FOR SALE - a few more boatanchors.
Pictures of all available on line (See below)

Clegg 22'er classic 2m AM transceiver with mobile microphone
and manual. Looks very good. sold as-is untested.
Will sell for $55.00 plus shipping

Heathkit HW-17 classic 2m AM transceiver with microphone.
Meter is missing but otherwise very clean.
Will sell for $45.00 plus shipping

Command Sets - ARC5 Receivers
A pair of BC-455 receivers - missing some parts, most tubes are gone.
Tuning dials and i.f.t. cans etc. are present as are most components
underneath the chassis.
These would need some major work, or use them as spare parts for your
repairs.
Will sell the pair for $10.00 each = $20.00 total plus shipping

CLASSIC 1940s-50s HOMEBREW TUNER
What a beauty! This jewel has all heavy duty components including a
dandy of a roller inductor with turns counter, The variable capacitors
are pretty
large and looks like it would handle a kilowatt with ease.
The versatile circuit is configurable for either series or parallel
'T' configuration.
Has jumpers in front to change set-up easily.
Has built-in SWR bridge utilizing an E.F. Johnson meter with controls
for FWD, REV and gain.
Case is made of hammertone finish steel with a removable
lid. There is a small chip out of one of the knobs.
Will sell this gem for $175.00 firm plus shipping

Rare Heathkit CB-1 Lunchbox rig.
Here is a Heath CB transceiver that could be used on either 10m or 11m
AM. Very rare nowadays. Most are hacked to pieces or in the
dump long ago. As you will see from the picture this rig is in very
clean condition. Looks like someone added a switch in the front
which could be very easily removed and the hole
filled and painted over to restore to like-new condition.
Will sell for $45.00 plus shipping

Heath Mobile Speaker
These are getting hard to find. Excellent condition. Has not been
beaten up and repainted like some you see. The perfect companion to

any HW series Heath rig.
Often used mobile with the HW-12, HW-22 and HW-32 radios, but also a fine mate to the HW-17 for sale above.
Offered for only $22.00 plus shipping

Heath HW-202
Classic Heath 2m FM mobile transceiver with plenty of chrome.
Condition unknown, sold as-is. Looks like it's all there. Comes with the microphone. Will clean up nicely.
Comes with the ORIGINAL (thick!) manual, original Heath microphone, cables etc.
Untested and will be sold as-is for $39.00 plus shipping

Also original Heath HA-202 amplifier manual $8.00
Original Heath Micoder HD-1984 Manual for $8.00

Heath HD-15 Phone Patch. Unit is in excellent condition with all original knobs etc.
Will sell for $22.00

Lafayette Capacitance Substitution box
Model 99-50205 in excellent condition with test leads.
Will sell for $20.00 plus shipping

Yaesu SP-901P Phone patch / Speaker Accessory
Perfect to round out your FT-901 line. Unit is in excellent shape but needs two scratches touched up on the top. Front looks great, including the original knobs, meter etc.
Will sell for $45.00 plus shipping

MFJ 204B Antenna noise bridge with original manual.
Will sell for $45.00 plus shipping

Palomar Noise Bridge with manual $45.00 plus shipping

But to be fair, Amateur Radio may be the only service where you
can build your own equipment, and equipment doesn't need to
be approved in some way. (The only other thing, apart from
Part 15 transmitters, might be some experimental license, but
then, you'd be likely be licensing an experiment, not offering
a broad license.) Since amateur radio has become less visible
over the years, and while once many at the FCC probably were hams
that can't be true now, phoning the FCC may more than likely reach
someone who doesn't know about amateur radio. Since it is an
exception in these matters, whoever answers may find it absurd
to even ask about using a home-made transmitter, or modifying
something from another service. So you get that sort of answer.

Also, I notice that public proclomations tend to be for the broadest
possible audience. So it's easier for them to say "no homebuilt
equipment" as a general answer, than to figure out that the person
is more qualified, for which the answer might include the exceptions.

If the average person phoned the FCC and asked about home-made
transmitters or modified transmitters, the answer would be no.
So generally, the answer was correct.

The only problem is when the questioner is in the exception,
at which point the information is wrong.

It would depend on the phase relationships between the desired signal and the nulling antenna. Also, the amplitudes and phasing must exactly correct to achieve a perfect null. It is doubtful that you would achieve a perfect 180 degree phase relationship and exact amplitudes for both the desired and unwanted signals.

Just a comment - adjusting the two controls on a noise canceller has precisely the same effect as swinging the polar diagram of a two-element antenna around until the null lies in the same direction as the noise is coming from.

The two elements, of course, correspond to the usual antenna plus the 'noise' antenna.

You can transmit (when its legal) with anything you can get to radiate within the FCC technical standards (bandwidth, harmonics, etc) --- otherwise we wouldn't be able to use BC xmtrs on 160m or military equip on the air.

Use the sidetone when practicing sending so your brain learns the
characters.
Concentrate on the receiving - the sending will follow. What good is it to
send
fast if you can't receive it? - The sending sta will assume you can
receive at the
speed you send at so its a bit embarassing to send 15 wpm to someone and
when they come back at 15, all you can handle is 5 wpm.

Although TV sets and computers are often a source of noise garbage
nowadays, I don't think that this gadget is quite intended as a cure for
that. It probably would work to some degree, but the noise from a
crappy monitor, or other computer cnx might be more easily addressed in
other ways.
Folks with decent outdoor antenna configurations don't seem to suffer as
much from computer noise as the guy with a new plastic portable radio
inches from his computer.
The efficacy behind the MFJ type of product is solid but it ain't a
miracle box.
-Bill

Who difficult is it to program a PRC-127? What kind of cable, software, etc., and how available are these items? There is a PRC-127 at a local pawnshop for $100, including hand mike and drop-in charger, but I've steered clear of it due to the programming issue.

5519. Drake TR5 for $20!

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-29 06:36:22 UTC
From: Sindre Torp <sindtorp@online.no>
Message-ID: <GR5z8.7530$ph2.200898@news4.ulv.nextra.no>
Source record: 44124

Yes, you may be the lucky winner of a Drake TR5 transceiver and the Drake PS7 heavy duty Power Supply for only US$20! Less than 3 weeks to the drawing.

For an updated list of ticket buyers, and more info, take a look at: http://home.online.no/~sindtorp/raffle.htm

Sindre, LA6OP

5520. Mirage D-1010 service manual

Hello,

does anyone have the service / repair manual for the Mirage
D-1010 or D-1010-N 432 MHz power amplifier?

The amplifier of our club OH8TA awaits repair and I need
some information to get started. I haven't been able to
get support locally from Finland. Thanks for any help!

Amateur equipment does not need to be type accepted before you can use it on the ham bands. The receiver's (depending on frequency coverage) need to be type accepted in order to manufacture them commercially. More than likely, the repeater you were using was itself made up from converted commercial equipment. Hams have been using military and commercial surplus equipment on the air for years. There was a time that the vast majority of 2M FM gear on the air was converted commercial surplus.

What *might* have been illegal was to use a military radio that still belonged to the military on the ham bands. Although it is done all the time, as I recall it is not legal to use an aircraft or shipboard radio that is a normal part of the craft's required communications equipment.

5524. Re: Kenwood TS-870S vs TS-2000

QST did an extensive review of both rigs. If you are an ARRL member, you can download the pdf for each and compare specs. It seems like I remember the 870 having a faster dsp processor but I would have to consult the articles. I have an 870 and am happy with it. The UHF bands don't interet me but if they did, I would prefer a seperate rig for that function so as to not tie up my HF capability while monitoring the UHF bands. Also, the 2000 is a big goofy looking.

I have a 2000 and I think it is fantastic. It has a very sensitive rx and the DSP filtering is just what you would expect it to be. I can slice right through QRM. I have had the rig now for 8 months. I have not used the VHF/UHF as much as I thought I would. For general repeater work and the occasional 6 meter openings, it is a great rig without any compromises (and it is all in one box). I like the rig and I'm going to keep it for a long time. While I wish I had purchased it before the price went down, it is worth what I paid for it.

Mike

There is one bit of "type acceptance" involved with amateur radio, and it is related to amplifiers capable of being used on (or near) 11 meters. Do not confuse this with other gear.

I think that's not true. You can design a homebrew kit to transmit
anywhere, but since equipment you purchase already made carries an FCC
certification, modification is technically illegal.

I remember reading something to this effect when someone posted
something about modifying their VX-5R to transmit on FRS (which is a
public band).

I don't think they can tell from your signal if you're using illegally
modified equipment, though. 8-)

Wait a sec, I think you have it mixed up. Your personal use is not commercial use. We as hams are forbidden to use our radios to profit but frankly it doesn't matter what kind of radio you're talking on. It would be legal for you to talk on 6m using a military singars radio also. You are a licensed amateur authorized to transmit on that frequency. The equipment used is NOT important. If I had been licensed when I was at Ft Bragg I'd have run my mouth all night on the Drop Zone with the Vehicle radio on 6m. I know I'm rambling a bit but to point out one more thing, hams use former military equipment all the time. A point in case are the WW2 era walkie Talkies which transmit in the 80m range.

The MFJ unit works quite well against broadband white noise radiated by the switching power supplies of recent RCA large screen TVs. The trick is to position a noise antenna so that it receives a signal at least as strong as that received by your station antenna. These power supplies radiate a very strong broadband signal, and I found it necessary to position an antenna a couple of feet long very close to the TV to get the required signal strength on the noise input. It was then possible to almost completely eliminate the noise by adjusting the phase and gain controls on the MFJ. For this type of noise, I'd have to say that it is, indeed, a "miracle box". Anyone with an RCA TV who thinks he doesn't have this problem should try unplugging it sometime (not just turning it off).

I've found the box not very effective with noise emanating from the PC monitor. Reason? The noise antenna picks up many more signals because of its proximity to the monitor, and those same signals are not all heard on the station antenna. In that case, you'll never be able to null the monitor signals, but the MFJ will do a nice job of amplifying them for you! If your noise antenna is outdoors and positioned so that it picks up monitor signals of about the same strength as your station antenna, it ought to be able to null them quite well.

I would disagree there. Hams modify commercially-manufactured amateur rigs all the time. So long as the rigs continue to meet the fcc spectral purity requirements, it's legal.

>I remember reading something to this effect when someone posted
>something about modifying their VX-5R to transmit on FRS (which is a

Yes, it would be illegal to put a modified amateur rig on FRS, but that does not keeps hams from modifying amateur rigs for use on amateur bands.

If you look at the FCC rules at
http://www.access.gpo.gov/nara/cfr/waisidx_00/47cfr97_00.html-
about all they tell you to do is meet certain emissions requirements. Nothing is said, that I can find, about what kind of gear to use (other than gear that has to be certified for use as an external amplifier).

> anywhere, but since equipment you purchase already made carries an FCC
> certification, modification is technically illegal.

That is not true ... the "certification" that you refer to on commercially
manufactured gear is just a Part 15 unintentional emissions test on
the receiver and the digital stuff inside ...
NOTHING about the transmitter is "certified" by the FCC in any way.

> I remember reading something to this effect when someone posted
> something about modifying their VX-5R to transmit on FRS (which is a
> public band).

THIS is a horse of a different color ... now you're not talking about
modifying a ham rig for ham operation (to improve something, add
a ham feature, etc.) ... what you're describing here is modifying a
non-type-accepted ham radio to operate in another (non-ham)
radio service where there IS and equipment certification or type
acceptance requirement (because the intended users in that other
service are "appliance operators" and the FCC doesn't allow them
to "tinker" with the insides.) THIS *is* illegal ... (modifying ham
gear to operate in other services where certification/type-acceptance
requirements exist.)

> I don't think they can tell from your signal if you're using illegally
> modified equipment, though. 8-)

I would caution all hams NOT to illegally modify ham gear to operate
in FRS or other near-by (spectrally-speaking) services that have
certification
or type acceptance requirements. If enough of this happens and the FCC
perceives it as a problem, they could impose further restricitions on ham
equipment (like the debacle with HF amplifiers, due to illegal CB use ...)

Besides, if you get caught doing it, you could lose you ham license and face confistcation of the equipment and a VERY hefty fine.

You can try this page. I see one on there that says it works with the
hamcomm interface. I just hope you have enough horsepower with that
8086. I'm not sure if you will be able to handle all the features
usually had like waterfall displays, etc. Myself, I run hamscope for
the most part. It's windows based.
I'm not sure the minimum CPU needed. I'm running it with a celeron at
about 500 mhz .
But it has some pretty good features like dual receive windows,
scopes, macros, etc. Also quite a few of the different modes including
cw. I used to use a hamcomm interface, but have gone totally soundcard
now. I want to eventually get a laptop for mobile/portable use. Also a
GPS to hook into it. MK

5540. WANTED: schematic for HF noise canceller (like the MFJ-1026)

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-29 20:32:24 UTC
From: jason_hsu@my-deja.com

Source record: 44145
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Where can I find a schematic for a noise canceller for HF? I would
like to homebrew a noise canceller/preamplifier that would be similar
to the MFJ-1026. (Unfortunately, the MFJ manuals available online
don't include the schematic.)

I would particularly appreciate an explanation on how the various
parts of the circuit work (noise amplifier, noise phase shifter,
signal preamplifier, filters, etc.) and the transformer specifications
I need (so that I can use something available to me).

This looks like a nice noise blanker circuit and I have saved it for future reference; however, it doesn't answer the original poster's question, "Where can I find a schematic for a noise canceler for HF." He's talking about the RF phase cancellation device like the MFJ 1026. I'd be interested too.

5548. HF rig recommendations

Newsgroup: rec.radio.amateur.equipment
Date: 2002-04-30 03:40:22 UTC
From: Peter Dougherty <ve3thx@nac.net>
Message-ID: <ab4scukdfve09sq52a60ru04jsadl9mn6a@4ax.com>
Source record: 44053

Hi Folks,

I will hopefully be looking at a new HF rig in Dayton this year, but having been using my trusty TS-820S for so long, I've kind of lost track of everything new these days.

While Irealize there will never be any such thing as a perfect radio (or at least, not one that's affordable to mere mortals), I'd appreciate a few suggestions for rigs that will give me the following must-haves:

1) continuous receive from 500kHz o so up to 30 MHz and TX on all ham frequencies within that range

2) Some form of DSP--preferably in the IF, but good audio-level DSP would be OK if I hear enough good things about it.

3) AM as well as CW, SSB and FM.

4) Serial interface that works with my logger, DX Base and with contest loggers

5) Built in second VFO

I need to come down under $1K new for this, and so far, I've been looking long and hard at the Kenwood TS-570D(g). While it sure looks nice, I'm honestly wondering if I could do better for around the same money, maybe with an older but fully-featured used rig. The Icom IC-746 also looks pretty good, but is the extra $$$ really worth it?

I'm strictly an SSB and digital-modes man so I don't need CW keyers/memories/filters, etc, but do need a way to narrow out and reject carriers and heavy adjacent channel QRM since I enjoy working DX and a few contests from time to time.

Thanks in advance to one and all. If replying by e-mail, please note the anti-spam reply-to e-mail address.

Look around on places like ebay and eham.net for a used Yaesu FT-847. They can be found for around that price, and have everything that you are looking for, and include 6m, 2m, and 70cm bands as well. I'm not totally sure about the compatibility with your loggers, as I have never gotten the serial interface application for mine.

That's different. FRS equipment has to be type accepted; amateur equipment
doesn't. Another poster to this thread mentioned HF amps. Vendors even
offer kits that will permit the licensed amateur to void the type acceptance
by modifying the amp to work on the 12 and 10 meter bands.

So that we can better advise you, what literature resources have you
already consulted? To what other resources do you have access? What does
Google say on this topic? Will MFJ sell a copy of the schematic?

I seem to recall that a primitive noise canceller circuit appeared in one
of the amateur magazines a few years back but I do not have the reference
for you.

You might also contact AEA/Tempo who are again providing the ANC-4 unit.

2 meter mobile rig, with additional Hammond 12VDC power supply for indoor
use. Unit has been recently tested and found to be working perfectly.
Model and description can be seen at: http://www.rigpix.com/yaesu/ft270r.htm
Moving very soon, so I must sell.

$200.00 or best offer

Email me for payment and delivery instructions

The TNS used a different method of noise suppression. It is 100%
different from an ANC 4 or MFJ 1025/1026 device.

The TNS clipped noise spikes based on AGC voltage INSIDE the receiver.
The ANCs keep the noise from getting into the receiver!!

A former TNS user and a proud owner of the ANC 4 and former owner of the
MFJ 1025.

BRAND NEW==>XTS3000/XTS5000 Batteries<===

Hi:

I have come accross a number of Brand New, Never Placed
in service NTN8294B Series Batteries.

Never placed in Service, and the exception is the
Date Code is late 2000 (047LU)

I have fully checked each battery, and it does match / Exceed
Factory Specs.

These have a User Price of 95.00ea, and even wholesale
they are aroun 50-80.00 depending on quanity.

Qu. 1 - 2 30.00ea
Qu. 3 - 5 28.00ea
Qu. 6 - 10 25.00ea
Qu 11 and up 20.00ea

Please alow 8.00 for pirority mail S & H

Monty

I live about 100 meters from 3 sets of 3 phase lines, 66 kv, 88 kv and 105 kv, on the New England Power Grid. I am about 1/4 mile from a substation and 3 miles from a major power generating station on the NE Grid. Potential for lots of line noise and insulator noise.

The MFJ 1025 does not have a preamplifier and was not sensitive enough for my needs. BTW, the 1026 has a preamplifier but I have not used that model.

I picked up the Timewave on eBay for $60 to give it a try. With a small dipole [12 feet] about 1 foot above ground level I can null out S8 power line and insulator noise. This meets my needs. The MFJ 1025 just will not do that at my installation.

Be sure, when you are looking, that you are looking for a rule that prohibits the use of commercial or military radio equipment in the AMATEUR RADIO bands. At least, that's the issue here as I understood it.

Will be awaiting your findings.

Jason:

I recall, perhaps incorrectly, that you graduated from an engineering school last year or maybe this year. If that is so, you are sure not giving the school a very good reputation. In my senior year in Physics, we were expected to be able to do exactly what you are asking someone else to do, i. e. draw a block diagram of a system based on the intended application, describe the functionality of each block, and then design a circuit to fit in each block. That was 40 years ago, actually closer to 50. Have college standards dropped that much? All the old profs must be turning over in their graves. :-((

Hi

I'm looking for an extended TX mod for an IC910H. The mod found on the www.mods.dk site does not work.

Thanks in advance.

regards

Tony

Dear Sir/Madam,

I bought a Yaesu VR-500 receiver recently. It is very handy that I can program the frequencies, etc, on a PC and download them into the radio. What kind of memory does the radio use internally? Does it has a limit about how many times the memory can be written?

Regards,

Sam Yang

I think you will find your 757 does not transmit below 1500 KC. Nothing would prevent you from using it on the 60 meter band once approved. That is if they don't add some new regulations pertaining to the band.

With all due respect to your extra buddy and the FCC they both suffer from extreme constipation...

No different from a homebrew rig, or any other military surplus. The extra is ignorant, the FCC has someone you talked to that was afraid if they didn't tell you NO, they might have given tacit permission.Never ask a bureaucrat for permission for anything.

> anywhere, but since equipment you purchase already made carries an FCC
> certification, modification is technically illegal.

If the factory made equipment is made specifically for Amateur use it is NOT certified as this is not required.
If it was originally made for commercial or military use it is certified - but when you use it for Amateur purposes this is irrelevant - if you then modify that equipment - the certification is voided - which means that it may not then be returned to military or commercial use.

>
> I remember reading something to this effect when someone posted
> something about modifying their VX-5R to transmit on FRS (which is a
> public band).
>
This is exactly an example of how I understand it - Uncertified Amateur equipment may NOT be used on NON amateur bands. The VX5R is not certified for FRS - so may not be used on FRS but you may modify it all you like for Amateur use (provided is stays within the bandwidth and other signal parameter limits of course)

I had recently seen this, somewhere, and it escapes me where.

I am looking for a power distribution strip with the Anderson Powerpole connectors built in. It had about 5 of them for output and a few other bells and whistles. I think it sold for about $70?

I am not finding a saved Usenet message or anything in my browser history, but I do remember seeing it on a website. Altavista doesn't find it, either.

TIA,
Happy trails,

Try making one - I have constructed one with 6 outlets on it, and a socket on the side of it so that I can either use it with the power supply or with a 12v battery for when the mains are out due to storm activity etc.

Matt

If the noise saturates or overloads the detector, audio processing is often too late in the receiver chain to fix noise. There is nothing to recover if there is not any signal left after the detector. It all depends on what is going on at the detector stage.

Remember all those impulse noise reduction circuits that detected an impulse and reduced the RF/IF gain for the duration of the impulse? They worked pretty good, didn't they?

[Why does pressing the noise reduction button on a TS50S work a lot better than pressing the same button on a commercial marine ICOM M710 SSB?]

One can download for free a audio filtering app complete with source code for the Analog Devices 21xx DSP dev kit that does a lot of reasonable DSP audio things.

5593. Re: Kenwood TS-870S vs TS-2000

Message-ID: <63797002.0205010630.43f6d09c@posting.google.com>
Source record: 43998

Steve,

The DSP in the TS870 is NOT faster than that in the TS2000. The 870 uses two 24 bit Motorola 40mHz DSP chips, with 24 bit D/A converters running at 20 mHz. The TS2000 uses two 100mHz 16 bit Texas Instruments DSP chips, with 24 bit D/A converters. In fact, in my opinion, the DSP in the TS2000 is better than that in my TS870. It's more effective and implemented better than on the 870. For instance, you can use multiple DSP functions (noise reduction, auto notch and beat cancel) simultaniously in the TS2000, something you can't do in the 870. You might expect this given that the DSP technology in the TS2000 is over 5 years newer than that in the TS870.

I've owned both rigs and read most every review anywhere about both of them. I traded my TS870 for a TS2000, not simply for the extra bands (though that was a factor), but primarily because the 2000 gave me essentially the same HF receiver performance as the 870 with more modern technology, better DSP, a quieter receiver and 3 extra bands to boot. If you don't believe the TS2000 holds it's own against the 870 on HF, compare the HF specifications in their respective QST reviews.

Whether the TS2000 is "goofy looking" is a matter of opinion. I initially was hesitant to trade my 870 for the 2000 because because I liked the way the 870 looked more than I liked the look of the TS2000. I still like the way the 870 looks, but the TS2000 is much better looking in "real life" than in pictures and it does grow on you after you use it. It is by NO means a "big" radio. It is about 2/3 the size of the 870 (about the size of a TS450) and weighs about 7 pounds less, while being a very solidly built rig. You can also monitor 2 meters and 440 FM while using the HF bands- which is a suprisingly nice feature after using it a few times.

Would I trade my TS870 for the TS2000 over again? Yes, without hesitation!

73,
Scott, N9AI

Thanks, that is exactly the one I was looking for.

I may end up building one instead, but it's good to see what the
commercial ones offer. I like the ideas of a modular power cord,
separate quick change fuses, and would prefer to go over to the
Anderson Powerpole standard.

Hi Fellas;
I have for SALE:
1- bag of 120+ asstorted chokes, most are 2.7, 153.3, 1.7, 146, 105, 42, 3.1uH & 4.0mH Price is $20ppd>>
http://www.myradioroom.com/120asstchokes.jpg

2- 56 chokes, marked #970, measure 1.04mH, Price is $14.00ppd>>
http://www.myradioroom.com/56wwchokes.jpg

3- 250+ Chokes , measure 3.3uH, all NOS, price $12.00ppd>>
http://www.myradioroom.com/250chokes.jpg

4- 12 miniature meters, 10 are RF/S type, 1 is Battery, 1- not marked. Great for small tuners , qrp, etc. These are pulls & 6 have built in bulbs. All have been tested with a VOM for meter movement only! Prics is $20ppd>>
http://www.myradioroom.com/12meters.jpg

5- 35 assorted wire wound Toroids/chokes, blanks, remove the wire & wind your own. Price is $20.00>>
http://www.myradioroom.com/35toroids.jpg

6- 200+ ferrite chokes. I measured a few at 1.0uH average, all are NOS, Price is $12.00ppd>>
http://www.myradioroom.com/200chokes.jpg

All buyers will receive a small bag of free goodies.

Thanks es 73....Rich WA2RQY (1961)

You were able to find a bulkhead mount PowerPole for this?

That is the kind of use I am looking for, attached to a direct-wired
outlet in the car, or a portable battery pack for a portable setup.

Happy trails,

5615. Re: Kenwood TS-870S vs TS-2000

Newsgroup: rec.radio.amateur.equipment
Date: 2002-05-02 04:36:01 UTC
From: JB <ac6tk@nospamcybertime.net>
Message-ID: <aaqgkcqro1@madmax.keyway.net>
Source record: 44020

I've never tried an 870, so I have to compare to my 830.
I still prefer the speaker audio in my 830, but that's about it.
The 2000 and 830 are neck and neck in sensitivity (at 40M) and
in it's ability to pick out good signals, but the DSP bag of tricks
really tips the scales. Also, I was shocked how wonderful the
transmit audio sounds from this rig (dtmf mic). And Zero drift.

Also, as an old time SWL, I finally have a general coverage RX
that surprises me every time I use it. One thing I never had before
is the ability to receive SSB with adjustable bandwidth out to 5kc,
so that there is no sacrifice in fidelity when selecting either sideband
of an AM station to beat QRM. And with the DSP tricks, this thing
can make a no strain signal out of DIRT!

Unfortunately the internal antenna tuner is no better than anyone
else's internal tuner, so I have to put up with tuner losses, use a big
external tuner, or fire up the 830, which is more versatile and efficient
with it's wide range Pi network TUNE and LOAD controls. Over and
over again, I find that with the 830 I get reports of 2-3 s units
improvement bypassing the tuner and using the Pi Net if I can.

This should be less of a problem if I just use my 30L-1 when called for,
but they sure look weird side by side! Like a sports car next to a
pickup truck. The 830 is such a nice and useful rig it stays in the shack,
but the 2000 will probably see more use.

"Scott" <scottmanthe@netscape.net> wrote in message
news:63797002.0205010630.43f6d09c@posting.google.com...
: Steve,
:
: The DSP in the TS870 is NOT faster than that in the TS2000. The 870
: uses two 24 bit Motorola 40mHz DSP chips, with 24 bit D/A converters
: running at 20 mHz. The TS2000 uses two 100mHz 16 bit Texas Instruments
: DSP chips, with 24 bit D/A converters. In fact, in my opinion, the DSP
: in the TS2000 is better than that in my TS870. It's more effective and
: implemented better than on the 870. For instance, you can use multiple
: DSP functions (noise reduction, auto notch and beat cancel)
: simultaniously in the TS2000, something you can't do in the 870. You
: might expect this given that the DSP technology in the TS2000 is over
: 5 years newer than that in the TS870.
:
: I've owned both rigs and read most every review anywhere about both of
: them. I traded my TS870 for a TS2000, not simply for the extra bands
: (though that was a factor), but primarily because the 2000 gave me

: essentially the same HF receiver performance as the 870 with more
: modern technology, better DSP, a quieter receiver and 3 extra bands to
: boot. If you don't believe the TS2000 holds it's own against the 870
: on HF, compare the HF specifications in their respective QST reviews.
:
: Whether the TS2000 is "goofy looking" is a matter of opinion. I
: initially was hesitant to trade my 870 for the 2000 because because I
: liked the way the 870 looked more than I liked the look of the TS2000.
: I still like the way the 870 looks, but the TS2000 is much better
: looking in "real life" than in pictures and it does grow on you after
: you use it. It is by NO means a "big" radio. It is about 2/3 the size
: of the 870 (about the size of a TS450) and weighs about 7 pounds less,
: while being a very solidly built rig. You can also monitor 2 meters
: and 440 FM while using the HF bands- which is a suprisingly nice
: feature after using it a few times.
:
: Would I trade my TS870 for the TS2000 over again? Yes, without
: hesitation!

5616. Re: WANTED: schematic for HF noise canceller (like the MFJ-1026)

Newsgroup: rec.radio.amateur.equipment
Date: 2002-05-02 06:36:39 UTC
From: Chuck Hutton <chutton1@qwest.net>
Message-ID: <i85A8.119$8r5.137384@news.uswest.net>
Source record: 44021
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

It's not really a "noise canceller" as it is what MW and SW DX'ers call a simple phasing box. It's job is to create two signals 180 degrees out of phase and sum them to produce a null. In other words, it cancels whatever arriving signal is made to be 180 degrees out of phase in the two antenna inputs. In the case of the MFJ, one input is supposed to be a short whip or similar whose job it is to pick up the local noise source while the other input is the main antenna. I don't know how they do the phase adjustment works (could be L-C, could be delay lines, could be a one of several other ways) but the fundamental idea is the same.

It is not considered a robust front end in the MW DX'ing community. Mixing products have been noted by a lot of people. If you want to roll your own, I'd look at other designs. Go to http://www.qsl.net/wa1ion/ and you'll find his web pages of presdelectors and phasing units. One of them will surely do the job for you.

Not to sure what you mean by a bulkhead mount power pole.
What I did was bought a plastic kit box approx 5x2x1 inches in size, 12 power sockets (same as what are on the front of power supplies - 6 red and 6 black), a strip of aluminium, wire, nuts and bolts. Additionally I bought one socket and two plugs which look similar to those you will find on coffee jugs.
First I cut two lengths of the aluminium strip long enough to fit lengthwise into the box. Then I drilled six holes through the aluminium and the box where I wanted the sockets to be. The sockets hold the strip to the inside of the lid, which is connected to the power supply socket by some 4 guage wire. I glued and bolted the power supply socket onto the end of the plastic box. The connectors from the power supply or battery have been fused thus offering additional protection in case I stuff something up.

I posted too soon. Additional research shows that there is a glut of
used Rocketport PCI-slot 4- and 8- port adapters as a result of the
dotcom crash...

My PC already has the usual two com port adapter. Problem is I need
four. Moreover, if you try to use com1-com4, you find yourself short
IRQ's in a hurry. The Rocketports apparently don't need an IRQ (or
use only one).

Hi All,

I have three KLM antennas for sale. They are:

KT34XA - 6-element tribander. Most popular contest/DX antenna ever made... $750

KT34A - 4-element tribander. Just like it's big brother, but half-size boom (16')... $500

40M4 - "World Class" 4-element 40-mtr monobander. Open and close the band. Has no peer... $1200

All antennas have 3-inch booms, are in excellent condition, still in the air (expected to be taken down by 5/11/02).

Located in Northport, NY, on the north shore of Long Island, in western Suffolk County.

Pics and more details at http://reallybig.com/tower. Tower is sold, sorry.

Pickup only, as I will not ship.

Thanks for reading,

73 de Jeff K2KV

Please reply to my callsign at reallybig.com

They are fairly easy to program. The battery is removed which allows access the front slide-off cover. There one of the buttons is a "function" and you put it into program mode. I have reprogrammed a couple years ago, but probably it would take a few minutes experimentation today.

The RigRunner has some nice features, such as LED indicators for blown fuses. It's a bit bulky for mobile use, but the West Mountain rep. at the Green Country Hamfest in Claremore, OK last Feb. said they should be coming out with a more compact mobile unit sometime this year, possibly by the time of HamCom in Dallas on June 8th.

bulkhead or panel mount. Most of them are meant to go on the end of a
loose cable; for this project I would want them with mounting ears or
flange to attach to the panel or box.

I will think through your design, and see if that would work for me.

Happy trails,
Gary (net.yogi.bear)

RocketPorts generally use a LAN connection so you may need to add a NIC to your machine. You will also need bootp or some other means of giving the Rockect Port an IP address. Digi makes a thing called the EtherLite which is like the RocketPort, but there are some very subtle differences.

http://www.digi.com/solutions/devtermsrv/netserialcon/etherlite.shtml

Since they are LAN devices they do not use IRQs.

A cheaper and easy solution for most applications is adding ports via a PCI slot. Something like

http://www.jdr.com/interact/item.asp?itemno=gr-mct-psp

Make a note of the software you are wanting to drive the port with. Plug and Play will generally assign memory addresses that are available to Windows, but not to DOS (Console) to these add in cards. If that causes problems you can fix this with the device manager.

73 and Good Luck,
Joe

I have a Radio Shack HTX-242 mobile radio that the backlighting for the display has failed. Does anyone have experience with this? Is the lighting the "grain of wheat" type of bulbs or ?? Does anyone know what ratings these bulbs are if they are "grain of wheat" types? Any particular problems or other headaches with the replacment of these?

I barely trust my "fat fingers" in such a small area, especially with a soldering iron so I want to take any and every precaution. Any suggestions would be great!

Thanks in advance,

I found a fantastic solution -- Edgeport by digi--- One USB plug to 8 rs232 ports -- I bought one a few months ago and actually used up most the ports:

serial port for: Ts870, TMV7, BC780 Scanner, Netgear Router, PK232 for HF, 2 TNCs for VHF/UHF.

work great. soo great, I bought another and just hooked it up . i have COM 1 through COM 19 now .

Paid $99 each on ebay.

Almost all programs can use it -- some software has trouble with the higher com port numbers -- but XP handles it all perfectly.

cheers

GE Portables

GE MPA VHF 146-162 full system keypad. Radio is as new and is almost perfect. The only flaw is the grip tape under the PTT button is peeling at the edges. Otherwise perfect. The next feature is, The radio is Key pad programmable. 16 channel scan and front face programmable. Has a like new battery and a good rapid charger. Also a belt clip. $500.00

GE MPA VHF Select 157 - 174 split. Nice radio 9 condition with battery and standard charger. I have it programmed down to 154 MHz with no trouble but will go no lower. $200.00

GE MPA UHF Scan 440 - 470 192 channel scan. Radio works great. A little paint wear on the edges but I have seen worse. With charger and battery. $225.00

GE MPD UHF select model 440-460. 48 channel alpha-Numeric display. programmed on the 440 ham band and works on the local repeaters and GMRS. With Battery and standard charger. Nice 8 - 8.5 radio. $100.00
Also have 1 in about a 7 condition $90.00

GE MPD select model 470.- 488 MHz. 48 channel Alpha-Numeric display. With battery and standard charger. 7-7.5 $90.00

GE MPD Scan UHF 440- 460. 48 channel Alpha-Numeric display. Also programmed on the hamband for testing. Works on the local repeaters and GMRS. with battery and standard charger. $125.00

GE MPD scan VHF 150.8 174. 48 channel Alpha-Numeric display. These look good and come with a battery and standard charger. 125.00 each.

MPD Voice Guard VHF system model with full keypad. 48 channel alpha display. with battery and standard charger. $135.00

GE PCS UHF 8 channel. I have this radio on the uhf ham band for testing and it works the local repeaters. with battery and charger. $90.00

GE MPS VHF Like new 10 channel. With new battery, new antenna, and a standard charger. $65.00

GE MPS VHF 12 channel. Set of 4 that talk to each other with all new batteries and antennas. All in a rack charger. $225.00

GE Monogram UHF 10 channel portables. 3 radios 2 new batteries and 1 good battery. With 1 dual slot charger. $200.00 all 3 radios.

GE Monogram VHF 10 channel portable. 157-179 split. ex CSX radio. I sold this radio a year ago but have taken it on trade. Condition 8 with belt clip and charger. I had this radio run for stolen from CSX by a local CSX Special Agent when I first bought these in a lot and was told that it had been sold at salvage. Perfect for a RR Museum or shortline on a budget. This could also be programmed for marine frequencies. Like new tall Battery. $100.00

GE Mobiles

GE Phoenix SX VHF 128 channel scan. No accessories. Has all 8 proms. $100.00

GE MLS UHF 8 channel. With Mic, power cord and hang up box. MLSU240 450. - 470 Looks good. $125.00

GE MVS UHF 16 channel scan. With Mic, Bracket, and power cord. $125.00

GE Mastr exec II VHF 75 watt mobile complete with accessories. $60.00 each

GE Mastr exec II VHF Mobile extender (repeater like Pac rt) for Mastr II or Delta. $20.00 each

GE Mastr exec II VHF Mobile extender for GE Ranger (only Exec II that I have seen marked Ericsson) $65.00

.GE Ranger VHF 150.-162 100 watt mobile. Complete with cable, Mic, speaker, and S550 control head. This is a great public safety mobile or can be tuned to the 2 meter ham band. $175.00

GE S990 head. Looks new but I have not had time to test this yet. $75.00

GE S550 head 16 channel looks good but not tested. $35.00

GE Mobile Vehicle Adapter For MPA, MTL, MPD, and TPX. This unit charges your battery and turns your portable into a mobile radio. (Convert a Com) With mic, speaker, and power cable. $100.00

GE Accessories

GE TQ 2310 suitcase programmer. Has PLS, Phoenix, Delta s/sx, Voice Guard, MPS, and Ranger. Printer is not working but I tried and it programs radios without the printer. Has manual for the programmer and the computer. Has Phoenix cable and Voice guard cable. All in the original GE case tested and working. (except printer) $850.00

Mastr II control cable. $8.00 each

Mastr II head for mobile repeater operation. $5.00

Mastr II Mic. $5.00

Mastr II 8 channel tone boards. $5.00

Mobile Repeater cable for Mastr II. $10.00

Mobile Repeater cable for Delta or Ranger. $30.00. I have seen programming cables made from these.

GE white Versatones, 103.5, 162.2, 173.8, 179.9, 186.2, and 203.5. $4.00 each. I have a large amount of 203.5,186.2, 179.9, 173.8, and 162.2. If you buy 10 = $3.00 each. Buy 15 =$2.50 each. Buy 50 = $1.50 each.

GE Mastr II Icoms. EC = $5.00 each, 5C = $10.00 each.

GE Delta cables. These are the downloading type used with the S820 heads. And all other heads $40.00 each

Delta mounting plates. $10.00 each

Ranger mounting plate. $15.00

GE S-550 / 500 and others mounting brackets. $5.00 each

GE MPA, MPD, MTL public safety mic. $35.00 each

GE MPA, MPD, MTL standard Speaker mic. $25.00

GE PCS Universal charger.With wall transformer $20.00 each

GE MPA standard chargers. $20.00 each

GE MPA Rapid chargers. $30.00 each

GE MPI desk charger with wall transformer. $10.00

GE MPI Rack charger, 8 position. 25.00

GE MPI Mobile battery charger, Rare. $20.00

GE Battery discharger analyzer. For MPA, MPD batteries. Attaches to a rapid rack charger with a DB 15 cable and uses a MPD body to attach a battery to. Has LED readout in display area of MPD body to tell discharge rate. Another rare GE goodie. $45.00

GE shoulder strap like new, attaches where belt clip is. $15.00

GE Belt clips. $10.00 each

GE Voter. Has 9 total rec. cards and 2 TX cards. With extender card and power supply / speaker. $300.00

Other Radios and Accessories

Motorola Saber III VHF 146-174 split. 120 channel Alpha-Numeric display with secure - net module. (no out of country sales) des I think. I have been using this all week and talking on the ham band to test this radio. Battery

has lasted all week during drive time so it seems good. With rapid charger and big battery. $500.00 or trade for a VHF MRK II

Motorola P-200 VHF 136. - 150.8 with rapid charger and new battery. Programmed
on ham band for testing and works great. 6 channel radio. $120.00 I am re-listing this a
second time because people have told me they would send money and didn't.

Icom 3200 a Dual band ham radio. Has box and manual but no mounting bracket. Has tone squelch board installed. $205.00

Icom IC 24-at Dual band Portable. In good shape, Display has no scratches and only 1 small patch of the paint is peeled off of the back of this radio. With manual and wall charger. $170.00

Maxon 5050a Low band portable pair. Like new condition with 1 battery charger but I will split up the pair if someone wants 1 radio only. 6 channels programmed for 10 meter ham band on 2 repeater pair and 4 simplex frequencies. 2 radios and 1 charger $195.00

Marconi UHF portable. 16 channel scan with NOS battery. Made by Midland. $75.00

Midland 70-336B VHF Mobile radio. 8 channel scan. with mic.$75.00

Motorola GP300 VHF 2 channel. on ham band. Has battery OK condition and charger I had to re-list due to a deadbeat buyer. $150.00

Motorola Mitrek VHF high 110 watt drawer only. $50.00

Motorola Adapter for MX radios for the 1801 suitcase programmer. A and B prom. $175.00

Motorola MT500 VHF nice shape. Crystals removed but I have 1 set of crystals for each radio. Also have a working battery and charger for each. I have 4 of these. $50.00 all

Uniden SMS 825 ts, 800 MHz Dash mount radio. $75.00

Voter from IMTS phone system. 2 rec and 2 tx cards. $40.00

Maxon Rapid Rack charger for 0510/0520 radios. Think they will work with the sp2000 as well.$35.00

Consignment section

This area is for a few friends who like those other radios you know

"Motorola" They are good people and I will pass along any trades you may wish to make.

Motorola X9000 VHF 50 watt, Alpha-Numeric head, Siren complete. $425.00

Motorola single rapid chargers for HT600, MT1000, P200. $25.00 each

Motorola HT1000 UHF Intrinsically safe, Re-cased looks new. 16 channel scan with
charger. $425.00

Motorola P200 UHF high power. 6 channel. $150.00

EF Johnson Challenger UHF 80 watt trunk mount, 99 channel Alpha-Numeric head.$225.00

Want List not FS
Extra parts for suitcase programmers. Data modules, Printers, cables, proms, anything you have extra. MPA or MPD portables what do you have and what do you want for them?
Johnson scorpion program cable.

Terms
All prices are plus shipping from 40201. All items are used unless noted and only have a no DOA warranty if I say it works. If I say not tested your on your own. 5647. New search options at radio-portal

Newsgroup: rec.radio.amateur.equipment
Date: 2002-05-03 12:37:18 UTC
From: Willi Passmann <DJ6JZ@compuserve.de>
Message-ID: <aau0be$7ma$00$2@news.t-online.com>
Source record: 43951

The search engine radio-portal
http://www.radio-portal.org
was restructured completely. Now the following search options are at
your disposal on the start page:

Detail Search:
Here you may enter several search terms, which can be combined by the
operators
exact / and / or.
These functions offer the opportunity to adopt the selectivity of a
search. This is a great improvement compared to the previously used
routine. Now your search phrase does not have to fit exactly the
text in the database to get a usable result.
Additionally, a search can be restricted to one of the 63 categories.

Category Search:
These option corresponds to the former "Search in broad". Here you can
combine two of the given categories by the operators
and / or / not.
For example 'Reviews' and 'Antennas', to get an impression on choosing
one's own equipment.
This search routine is extremely useful to get an overview on a field of
interest - a search phrase is not necessary.

Advanced Search:
On a separate page all functions mentioned above can be combined at the
same time. So it is possible to restrict the number of results to a
senseful value or to find entries belonging to various search phrases or
categories.

I am currently working to enable a search within results pages as a
further option.

You will find further explanations and operating examples via the "FAQ"
Button.

The Classified Advert pages have been updated also. Here you can offer
or search for hobby related items.

I hope you will like the new options. They are meant as a help to find a
quicker way to radio related information. Meanwhile more than 34.000
pages are in the database - all of them were checked manually. Probably
one of the reasons, radio-portal got the Millenium Innovation Award by
Radio Netherlands Media Network in the year 2000.

Your comments will be appreciated.

Regards, have a good weekend.
Willi Passmann, DJ6JZ

>

Yes, and even then only if they are *commercially* made (ie, made for sale). Licensed hams can build our own amp's and/or modify commercial ones to work in the 10-meter band even tho that voids the latter's type acceptance. These home-brewed (one per year IIRC) and mod'd amp's can also be sold to other licensed hams. We can use and even modify type accepted radios to work in our freq bands; however, in some cases such mod's void the rig's type acceptance so the mod'd radio may no longer be used in the band (eg CB) for which it was type accepted.

5652. FS Kenwood TS-120 Station

Newsgroup: rec.radio.amateur.equipment
Date: 2002-05-03 14:40:03 UTC
From: Charles Hugg <chashugg@earthlink.net>
Message-ID: <7jxA8.968$Be5.115236@newsread2.prod.itd.earthlink.net>
Source record: 43957

I am helping a friend sell his complete Kenwood TS-120S station. This gear has hardly been used. It has been stored for years and looks almost new. The station consists of the following pieces:
1. Kenwood TS-120S HF Transceiver. This radio receives well. It transmits over 100 watts on all bands. However, it transmits CW/Carrier even in SSB and the Carrier Control has no effect. This is apparently a common problem with the 120S. There is a modification to correct this problem listed on the Internet. Also, digital readout goes blank once in awhile. Price is $185.
2. Kenwood PS 30 Power Supply. As New. Price is $95.
3. Kenwood AT-120 Antenna Tuner. Very nice with Oirginal Manual. Price is $85.
4. Kenwood MC-35S Noise Cancelling Mobile Mic for TS-120 and TS-130s. Price is $40.
5. Kenwood MB-120 Mobile Mount for use with TS-120s and 130s. Price is $35.
Buyer pays shipping on all of the above listed items.
Package deal: $390 for all plus shipping.
Thanks, Charlie Hugg, K5MBX

I'm on a second floor and getting 220 up there might be tough. Sooo...
I'm looking for suggestions for a near legal limit amp that will do a
good job running on 110-120 volts.

I often see comments that you should "run this amp on 220" and I'm not
sure of what concerns there may be at the lower voltage.

Thanks for your input!

Steve,

I use a Heath SB-200 amp on 115 VAC. My shack is in an upstairs bedroom at the opposite end of the house from the nearest 220 VAC source. It's also against the National Electric Code to have a 220 VAC source in a bedroom (although I have to wonder about an extension cord of some kind, as that would be a "temporary" source). Anyway, I get about 650 Watts PEP output on 80 and 40m, 600 Watts out on 20m, 500 out on 15m (10m isn't working, probably due to a bad cap in the input tank circuit; too lazy to fix it). The lights in the room dim significantly when I'm key-down, but I haven't looked at the line voltage. The room has a 15 amp breaker, and it has never tripped. That same circuit is also running the lights, ceiling fan, and my other ham gear. This is definitely "pushing it", but it's working so far. I seldom use the amp anyway.

73,
Dean, K5DH

In order to have 1500W out, the AB class amp needs to dissipate additional 1000W, which means that you'll be drawing over 20A from your standard household 120V outlet. Unless your home has been wired very rugged, this type of current will create a significant voltage drop on the line and your amp will never get 120V on the transformer(s), which means that you will be unable to run the full power because the HV supply will be soft and your tubes will get less than the required filament voltage. Let's say your voltage drops from 115V to 104V - this will effectively reduce the 3-500Z filament voltage from 5.0V to 4.5V.

Utilizing 240V AC means you only draw 10A from the lines, otoh. If your lights in the house dim when your wife's using a hair dryer, I would not attempt the amp hookup to 120V. Also, most of the household circuits (with the exception of the heavy duty appliances like the stove and the water heater) are fused by either a 15 or a 20A circuit breaker, which means you'll be tripping it at that power level.

It's not that tough. I've added 2nd story outlets -- the electrician went though the attic and dropped the lines to the second floor with no problem. Certainly, that would be cheaper than frying your 110 wiring with too many amperes; the 220 circuits have heavier wiring and heavier outlets.

I don't think there are any amplifiers that run legal output at 110 volts.

If you are still not game for 220 operation, consider the Ameritron AL-80A and B amplifiers. They use a "real" transmitting tube (3-500Z) and they operate just fine on 110VAC.

Message-ID: <3CD2E45E.D4AE4073@us.ibm.com>
Source record: 43966

I run an Ameritron AL-80B on a 120V outlet. My Omni 6 is also on the same circuit. I do not quite fully load the amplifier, but usually run it close to the recommended output. It typically reads almost 800 watts out (CW). My 120V line voltage drops 5 volts when I key the amplifier. Everything seems to work well. The B+ in the amplifier is at the recommended lower limit (2500 volts, IIRC).

I have been thinking about running a 240 Volt line. I'll probably get around to it next winter---maybe.

I am quite pleased with the amplifier --- bought it on eBay a few months ago. Tuneup seems forgiving. As far as I can determine, my Omni 6+ does not cooperate with external ALC, so there is no ALC control between the amp and the transceiver. For CW, it does not seem to matter much. For SSB (which I do not use much), I keep the drive down and hope I am not splattering. IMO, the difference between the AL-80B and a "full KW" is very little and probably does not count except in a really big pileup.

Any amp that has a 120V input will run just fine *IF* you supply it with 120 volts. The problem is that a full legal limit amp draws so much current at 120V that it is difficult not to have IR drop in the wiring and cause the voltage to be too low. At the very least you would need a 20A *dedicated* circuit with #12 wire - and that is on the edge in most cases, depending on the length of the run. If you run 220V then the amp only draws half the current. A 220V, 20A dedicated circuit wired with #12 conductors is loafing at a full legal output.

Another option is to get a 500 Watt amp. You can run it from a 120V circuit without much difficulty. A 500W amp draws about the same at 120V as a KW amp does at 220V and 500W is only 3db down from a KW. You save a bundle on the cost of the amp and repair parts too.

Why on earth would they do that.
Mine is wired for 220 (separate outlet/twistlok)
It's your bedroom...You can wire it the way you want...Unless of course you get a building permit to make the change.

Course, should it create a problem, your insurrance company might have a problem.

It appears they should be 6.3v 40ma pilot lamps. You can check out the parts list at RSonline. I need to replace mine as well.

I don't think its against the NEC to put a 220V outlet in a bedroom.
It could be some individual county's requirement.

If you wish to do it with 120vac, make sure the circuit is rated for 20 amps minimum, and the amp is the only load on it.
An SB-200 or FL-2100B should work fine in that situation.

Amp Supply Co. LA-1000 HF Amp. 160-10m

Have for sale or trade an Amp Supply Co. LA-1000 HF amplifier. Late 80's model, with Ameritron serial placard. Manual states 500-600w output. Tubes are doing about 450 on 80m. Amp is in good shape and working perfectly but has a few scratches. Power switch has been replaced with incorrect but heavy-duty switch. Looking to sell or trade for a Dualband mobile such as TMV-7A or similar. Will only consider Icom, Kenwood and Yaesu mobile ham radios depending on mod availability. Will also consider only Motorola/Radius handhelds or mobiles (Max, GM, M1225, etc, as well. Jedi, Radius or Pro series.) Prefer VHF. U-ship, (will average $20-$35 CONUS).
Thanks and please reply direct,
Randy, KC8CPK

Hi All

Can you help me please?

I have one of the above which seems to have no RF output.

I got it recently from a Ham who has stopped operating and, as a result, it has been stored for a couple of years in his loft.

All the indications are that it is OK in that it is clean internally (no burnt bits!!) and I have changed the valves. The relay also operates OK.

Both the plate and grid current meters respond to input from my TX (FT-920) and will also respond to tuning by the Load and Plate Capacitors.

On standby output to my ATU (MFJ- 962D) is Ok.

Any assistance would be most appreciated.

Many thanks

Mike Williams

We bought a few 8,000 BTU air conditioners (more than adequate for most bedrooms) last year, all 110-120 volt. Even 16,000 BTU units were still 110-120 volt, IIRC, although they used the heftier (20 Amp) plugs and sockets.

The most cost-effective power distribution arrangement is a terminal/fuse block on a bulkhead or in a project box (e.g. Tupperware). Six gang is $15.99. See:

I don't have the info near me but I think that you will need to build a
way to change the voltage levels as I think the 757 operates with 5 volt
signal levels and most rs232 is +- 12 volts.

Agreed. The only restrictions on what equipment can be used on the amateur radio bands is the ones about the emissions out of band and the 27 MHz amplifier rule. These are not specific to any particular kind of radio. The first is defining how clean our signal has to be, and the second is a rule so that few 10 meter amplifiers are available to get 'converted' to the 11 meter band after the mess in the '70's and '80's. Additionally there is that new Radio Emissions bulletin thing which has sort of been condensed into a bit of Part 97.

You must use A FIF-232C CAT System modem with it Plus it will only work with 386 or slower puters.....CPU is too slow

<< Usually someone knows where I'm going, and I've been carrying a cell phone for
possible accidents or medical emergencies, but cellular coverage is not always complete. >>

AES-

I don't think you ever got a satisfactory answer to your question. Someone mentioned GPS, but no one mentioned Satellite Telephone!

I think your best bet would be an Iridium telephone, assuming you are at a place where you have a view of the sky. Just about any point on the earth's surface is within view of one or more Iridium satellites. When one goes out of sight, there will be one or more ready to take over automatically.

You may have heard that Iridium went bankrupt and was required to de-orbit their satellites. As it turned out, the system was saved in the nick of time. It is still in operation and looking for customers. I understand the U.S. Government is subsidizing them in return for free use of the system.

I don't know who you would contact, but you should turn up something by searching the web.

I'm confused???
If the baud rate is the same, why does it matter what speed the computer???
Just write your code to observe the character timing constraints.
I'm running my 757GX using an optocoupler to drive the data input.
That way, it's impossible to "hurt" the input.

Darn, just had mine open repairing a microphonic problem. They are indeed the grain of wheat (GOW) bulbs, seem to be around 5 of them IIRC (two for backlight, three across bottom for the buttons). Getting to them is not bad...the front board unplugs.

Disassembly: Pop the covers (watch the speaker conn.), remove the two screws top/bottom to release the front cover, pull the knobs and undo the nuts holding the plastic lightconductor in place (watch out for the washers on the vol & squelch controls). The LCD and lightbar are connected via a pin/socket connector...carefully wiggle it loose. This will expose the control board. Three screws hold it in place...pop them out, carefully rock the board side to side to unplug from the connectors (2) underneath. The GOW bulbs are towards the edges of the boards, the only ones tough to get to will be the ones between the switches.

Rat Shak now has GOW bulbs in stock...check voltage and get the apropos bulb.

I didn't even lose memories. Must be a EEROM for memory, didn't see a backup batt.

Hope this helps!
Andrew
